They may be defined to be closed transparent, thin-sided membranous sacs, varying in form according to the part of the plant in which they are placed, and the purpose they serve.—2. ELEMENT'ARY SUBSTANCES. Chemists enumerate fifty-four simple or elementary substances; that is, substances which are found incapable of farther analysis by any means hitherto discovered. Five of these exist in a separate state, as gases; namely, oxygen, hydrogen, chlorine, azote or nitrogen, and fluorine; the last of these, however, has not yet been obtained in a separate state, and is only known to be a distinct substance, from the qualities of the compounds it forms with other matter. Seven are non-metallic solids and liquids; namely, sulphur, phosphorus, selenium, boron, carbon, bromine, and iodine; of these, the last two are either gaseous, solid or liquid, according to the temperature; the others are solids. Thirteen of the remaining substances are metallic or metalloid bodies, uniting with oxygen to form the earths and alkalies. [*See these terms.*] The remaining twenty-nine are metals. [*See* METALS.] These fifty-four substances are to be regarded as forming the elements of all bodies, whether animal, vegetable, or mineral; solid, liquid, or aëriform.

From these facts it would seem that *elf* is from a verb signifying to move, to flow; and *älf* or *elf* in Swedish, *elv* in Danish, is a river, whence *Elbe*. So *spirit* is from blowing, a flowing of air. In Sax. *æl* is *oil* and an *eel*, and *ælan* is to kindle; all perhaps from the sense of moving, flowing, or shooting along. Qu.] A measure of different lengths in different countries, used chiefly for measuring cloth. The ells chiefly used in Great Britain were the English and Flemish. The English ell is three feet nine inches, or a yard and a quarter. The Flemish ell is 27 inches, or three quarters of a yard. The English is to the Flemish as five to three. In *Scotland*, an ell is $37\frac{2}{10}$ English inches. *Ell* is also used proverbially for an indefinitely long measure. "Give him an *inch* and he will take an *ell*:" is a common proverb.

ELLIP'SIS, or **ELLIPS'E**, *n. plur. Ellipses.* [Gr. ελλειψις, an omission or defect, from ελλειπω, to leave or pass by, λειπω, to *leave.*] 1. In *geom.*, an oval figure produced from the section of a cone, by a plane cutting both sides of it, but not parallel to the base. The ancient Greek geometers gave this name to the figure, because, among its other properties, one is, that the squares of the ordinates are less than the rectangles under the respective abscissæ and the parameter, or differ from them in *defect.* The ellipse ranks next in importance to the circle. The paths which the planets describe in their revolutions round the sun are ellipses, the sun being placed in one of the foci. There are various methods of describing the ellipse upon a plain surface; sometimes this is performed by an instrument called the *elliptograph.* The simplest method of describing an ellipse is by two pins and a string. At a given distance equal to twice the required eccentricity of the figure, fix two pins A and B, and pass a string ACB, having its ends tied together; keep the string stretched by a pencil or tracer C, and move this all the way round, keeping the string all the while equally tense, then the figure CGLFHE will be an ellipse. A and B are called the foci; D, the middle point between them, the

Ellipse.

centre; DA or DB the eccentricity; EF, which passes through A and B, the major or transverse axis; GH, which passes through the centre, and cuts EF at right angles, the minor or conjugate axis. If from any point L in the curve, a line LK be drawn perpendicular to the axis, it will be an ordinate to the axis, and EK and KF are said to be the abscissæ corresponding to that ordinate. .. Also, any line drawn through the centre and terminated both ways by the curve, is called a diameter. [*See* CONIC SECTIONS.]—2. In *gram.*, defect; omission; a figure of syntax, by which one or more words are omitted, which the hearer or reader may supply; as, the heroic virtues I admire, for the heroic virtues *which* I admire.

ELLIP'TICALLY, *adv.* According to the figure called an ellipsis.—2. Defectively.

ELLIPTIC'ITY, *n.* Elliptical form.—2. A term used in the theory of the figure of the earth. It means, the fraction which the excess of the axis major, over the axis minor of an ellipse, is of the axis minor itself. Thus, if the axis major be 9 and the axis minor 7, the ellipticity is $9 - 7 = \frac{2}{7}$. It must not be confounded with *eccentricity.*

ELLIP'TOGRAPH, *n.* *See* ELLIPSOGRAPH.

ELM, *n.* [Sax. *elm*, or *ulm-treou;* G. *ulme;* Lat. *ulmus.* Qu. W. *llwyv*, a platform, a frame, an *elm*, from extending.] A tree. Whose taste…gave *elocution* to the mute. *Milton.*

Among *the ancient rhetoricians*, elocution was reckoned the third of those powers or acquirements which were judged necessary to an orator, invention and disposition being the first and second. It consisted in the ability to suit the language to the thoughts, in having words and figures of speech always ready and proper for the occasion. It was reckoned distinct from pronunciation or delivery, which belonged to another division of rhetoric: hence, the power of fluent speech; the power of speech generally; eloquence, beauty of words.

EL'OQUENCE, *n.* [L. *eloquentia*, from *eloquor*, *loquor*, to speak; Gr. λακεω, λασκω, to crack, to sound, to speak. The primary sense is probably to burst with a sound, for the Gr. has λακις, a fissure, from the same root; whence λακιζω, to open or split; whence L. *lacero*, to tear; and hence perhaps Eng. a *leak*. Qu. the root of *clack*.] 1. The expression of strong emotion, in a manner adapted to excite correspondent emotions in others. The art of clothing the thoughts in the most suitable expressions, in order to produce conviction or persuasion; power, beauty, and appropriateness of language. The word, in its most extensive signification, comprehends every mode in which deep feeling may be expressed, either by words, tones, looks, or gestures. Eloquence therefore requires, in its most perfect form, a vigorous understanding, a glowing imagination, appropriate and rich language, with fluency, animation, and suitable action. Hence, eloquence is adapted to please, affect, and persuade. The elements of eloquence are usually comprised under the four following divisions:—*invention*, *disposition*, *elocution*, and *delivery*. The first has reference to the character of the thoughts or ideas to be employed; the second to their arrangement; and the third and fourth have respect to words, style, utterance, action, &c. The Romans distinguished three kinds of eloquence:—the demonstrative, occupied with praise or blame, and address to the judgment; the deliberative, which acts upon the will by persuasion or dissuasion; and the judicial or forensic, which was used in defending or attacking. In our own times a division somewhat similar has been made, and the bar, the senate, and the pulpit, are the three grand arenas for the display of eloquence. With regard to the distinguishing characteristics of these three kinds of eloquence, *see* Blair, and Campbell's Philosophy of Rhetoric. Demosthenes in Greece, Cicero in Rome, Lord Chatham and Burke in Great Britain, and Fisher Ames in the United States, were distinguished for their *eloquence* in declamation and debate.—2. EQUA′TION, *n.* [Lat. *æquatio*, from *æquo*, to make equal or level.] 1. Literally, a making equal, or an equal division.—2. In *alge.*, a proposition asserting the equality of two quantities, and expressed by the sign = between them; or an expression of the same quantity in two dissimilar terms, but of equal value, as 3s.=36d, or $x = b + m - r$. In *the latter case*, x is equal to b added to m, with r subtracted, and the quantities on the right hand of the sign of equation are said to be the value of x on the left hand. An *equation* is termed simple, quadratic, cubic, or biquadratic, or of the first, second, third, or fourth degree, according as the index of the highest power of the unknown quantity is one, two, three, or four. And generally, an equation is said to be of the 5th, 6th, &c., degree, according as the highest power of the unknown quantity is of any of these dimensions. A *literal equation* is that in which all the quantities both known and unknown are expressed by letters; as, $ax^2 + bx = c$. *Determinate equations* are those into which only one unknown quantity enters; or if more than one enter, there are always given as many independent equations as there are unknown quantities.—*Indeterminate equations* are those in which there are more unknown quantities than there are independent equations.—*Exponential equations* are those in which the exponent or index of the power is unknown, as, $a^x = b$. *Differential equation* is that which contains in it certain differential quantities; and it is said to be of the first, second, third, &c. order, according as it involves the first, second, third, &c. differential.—*Equation of finite differences*, in the *theory* of *finite differences* or *increments*, is that into which the finite differences of the variable quantities of any function enter.—*Equation of partial difference* is that which takes place between the differential of any function, and the differentials of the variables on which it depends, combined with the variables themselves, and with or without constant quantities.—*Equation of a curve*, in *analysis*, is an equation showing the nature of a curve by expressing the relation between any abscissa, and its corresponding ordinate, or the relation of their fluxions.—3. In *astr.*, the term *equation* is used to express the correction or quantity to be added to, or subtracted from the mean position of a heavenly body, to obtain the true position, it also, in a more general sense, implies the correction arising from any erroneous supposition whatever.—*Equation to corresponding altitudes*; a correction which must be applied to the apparent time of noon, (found by means of the time elapsed between the instants when the sun had equal altitudes, both before and after noon,) in order to ascertain the true time. *Equation of the centre*; the difference between the true and mean place of the sun or of a planet.—*Equation of time* denotes the difference between mean and apparent time, or the reduction of apparent unequal time, or motion of the sun or a planet to equable and mean time or motion. 4. The reduction of any extremes to a mean proportion.—*Equation of payments*; an arithmetical rule for the purpose of ascertaining at what time it is equitable that a person should make pay ment of a whole debt which is due in different parts, payable at different times. The rule is now laid aside.

EQUA′TOR, *n.* [L. from *æquo*, to make equal.] In *astr.* and *geography*, a great circle of the sphere, equally distant from the two poles of the world, or having the same poles as the world. It is called *equator*, because when the sun is in it, the days and nights are of *equal* length; hence it is called also the *equinoctial*, and when drawn on maps, globes, and planispheres, it is called the *equinoctial line*, or simply the *line*. Every point in the equator is 90 degrees, or a quadrant's distance, from the poles; hence it divides the globe or sphere into two equal hemispheres, the northern and southern. At the meridian, the equator rises as much above the horizon as is the complement of the latitude of the place.

EQUATO'RIAL, *a* Pertaining to the equator; as, *equatorial* climates. The *equatorial* diameter of the earth is longer than the polar diameter. — *Equatorial instruments*. [*See the noun* EQUATORIAL.]

EQUATO'RIAL, *n.* An astronomical instrument, contrived for the purpose of directing a telescope upon any celestial object of which the right ascension and declination are known, and of keeping the object in view for any length of time, notwithstanding the diurnal motion. For these purposes a principal axis resting on firm supports, is placed parallel to the axis of the earth's rotation, and consequently pointing to the poles of the heavens. On this polar axis there is placed, near one of its extremities, a graduated circle, the plane of which is perpendicular to the polar axis, and therefore parallel to the equator. This circle is called the *equatorial circle*, and measures by its arcs the hour angles, or differences of right ascension. The polar axis carries a second circle, called the *declination* circle, the plane of which is at right angles to that of the *equatorial* circle. This last circle has a telescope attached to it for making observations, and which moves along with it in the same plane.

Being on horseback; as, an *equestrian* lady. —3. Skilled in horsemanship.—4. Representing a person on horseback; as, an *equestrian* statue. *Equestrian* statues are usually cast in bronze, and mounted on a stone or marble pedestal; few early monuments of this kind are extant, the valuable metal they contained tempting ravagers to destroy them. The most famous examples of modern *equestrian* statues are, that of Henry the Fourth on the Pont Neuf, at Paris; that of Peter the Great, at St Petersburgh; and the colossal one of the Duke of Wellington, in London. The *equestrian* statue of Charles the First, too, in the latter city, has some historical interest attached to it.—5. Celebrated by horse-races; as, *equestrian* games, sports, or amusements. — 6. Belonging to knights. Among *the Romans*, the *equestrian order* was the order of knights, *equites*; also their troopers or horsemen in the field. In *civil life*, the *knights* stood contradistinguished from the *senators*; in the *field*, from the *infantry*. During the middle ages, the distinction between *equestrian* and *pedestrian* men in Europe was maintained, especially in war, greatly to the disadvantage of the latter; the invention of gunpowder much modified the relative position of the two classes.

EQUIAN'GULAR, *a.* [L. *æquus*, equal, and *angulus*, an angle.] In *geom.*, consisting of or having equal angles; an epithet given to figures whose angles are all equal, such as a square, an equilateral triangle, a parallelogram, &c.

When two or more forces, acting upon a body, are so opposed to each other that the body remains at rest, although either would move it, if acting alone; those forces are said to be *in equilibrio* or *in equilibrium*; that is, *equally balanced*. [*See* STATICS.]—*Stable* and *unstable equilibrium*. When a body, being slightly moved out of any position in which it rests upon another body, tends to return to it; and being left to itself, will roll back of its own accord into it—that position is said to be one of *stable equilibrium*; when the body will *not* thus return to its previous position, its position is said to be one of *unstable equilibrium*. An egg resting on a table on its side is an example of *stable equilibrium*, and an egg balanced on its end is an example of *unstable equilibrium* —*Neutral* or *indifferent equilibrium*, when a body, being moved more or less from its position of equilibrium, will rest in any of the positions in which it is placed, and is indifferent to any particular position, its equilibrium is said to be *neutral* or one of *indifference*. A sphere or a cylinder resting upon a horizontal plane, is in a state of *neutral equilibrium*. A body suspended by its centre of gravity is in a state of *neutral* or *indifferent equilibrium*. If a body be suspended by any other point, it will be in a state of *stable equilibrium*, when its centre of gravity is perpendicularly below the point of suspension, but if the centre of gravity be above the point of suspension, the equilibrium will be unstable. — 2. Equality of powers.

3. Equal balancing of the mind between motives or reasons; a state of indifference or of doubt, when the mind is suspended in indecision, between different motives, or the different forces of evidence.

taining to the time when the sun enters the equinoctial points; as, an *equinoctial* gale or storm, which happens at or near the equinox, in any part of the world.—4. *Equinoctial flowers*, flowers that open at a regular stated hour.

EQUINOC'TIAL, *n.* [for *equinoctial line*.] In *astr.*, a great circle of the sphere, under which the equator moves in its diurnal course. This should not be confounded with the equator, as there is a difference between them; the equator being movable, and the equinoctial immovable; the equator being drawn about the convex surface of the sphere, and the equinoctial on the concave surface of the magnus orbis. These words, however, are often confounded. When the sun, in its course through the ecliptic, comes to this circle, it makes equal days and nights in all parts of the globe. The equinoctial then, is the circle which the sun describes, or appears to describe, at the time the days and nights are of equal length, viz., about the 21st of March and 23d of September.—*Equinoctial points* are the two points wherein the equator and ecliptic intersect each other; the one, being in the first point of Aries, is called the *vernal* point or equinox; the other, in the first point of Libra, the *autumnal* point or equinox. [*See* PRECESSION.] - *Equinoctial dial* is that whose plane lies parallel to the equinoctial.—*Equinoctial time* is reckoned from a fixed instant common to all the world.

These are called the *vernal* and *autumnal* equinoxes. These points are found to be moving backward or westward, at the rate of 50″ of a degree in a year. This is called the *precession* of the equinoxes.

EQUINU'MERANT, *a.* [Lat. *æquus*, equal, and *numerus*, number.] Having or consisting of the same number. [*Lit. us.*]

EQUITA'TION, *n.* A riding on horseback.

EQ'UITY, *n.* [L. *æquitas*, from *æquus*, equal, even, level; Fr. *équité*.] 1. Justice; right. In *practice*, equity is the impartial distribution of justice, or the doing that to another which the laws of God and man, and of reason, give him a right to claim. It is the treating of a person according to justice and reason.

> The Lord shall judge the people with *equity*; Ps. xcviii.
>
> With righteousness shall he judge the poor, and *reprove* with *equity*; Is. xi.

2. Justice; impartiality; a just regard to right or claim; as, we must in *equity* allow this claim.—3. In *law*, an equitable claim.

4. In *jurisprudence*, the correction or qualification of law, when too severe or defective; or the extension of the words of the law to cases not expressed, yet coming within the reason of the law. Hence a court of equity

or chancery, is a court which corrects the operation of the literal text of the law, and supplies its defects, by reasonable construction, and by rules of proceeding and deciding, which are not admissible in a court of law. Equity then is the law of reason, exercised by the chancellor or judge, giving remedy in cases to which the courts of law are not competent. In *Scotland*, the court of session, as the supreme civil court of the country, combines in itself all the functions of the English courts, both of law and equity.—6. *Equity of redemption*, in *law*, the advantage, allowed to a mortgager, of a reasonable time to redeem lands mortgaged, when the estate is of greater value than the sum for which it was mortgaged.

EQUIV'ALENT, *n.* That which is equal in value, weight, dignity, or force, with something else. The debtor cannot pay his creditor in money, but he will pay him an *equivalent*. Damages in money cannot be an *equivalent* for the loss of a limb.—2. *Chemical equivalents*, a term introduced into chemistry by Wollaston, to express the system of definite ratios or proportions, in which substances reciprocally combine, referred to a common standard of unity. If we assume hydrogen as unity, it being the substance which combines with others in the smallest relative weights or proportions, then all other substances may be represented by certain multiples of that unit, expressed with sufficient precision for all ordinary purposes by whole numbers. Thus upon this system the equivalent number of oxygen will be 8, and that of water will be 9, for 8 oxygen + 1 hydrogen = 9 water; and the equivalent of potassium will be 40, and of potassa, or oxide of potassium 48, for 40 potassium + 8 oxygen = 48 potassa. The equivalent of sulphuric acid is 40, for it is composed of 16 sulphur + 24 oxygen = 40 sulphuric acid. Again, when these compounds unite, one equivalent of the one combines with one, two, three, or more equivalents of the other precisely as the simple substances do. Hydrate of potassa, for example, is constituted of 47 parts potassa, and 9 of water, and its equivalent is consequently 47 + 9 = 56. These equivalents are often expressed by symbols. [*See* CHEMICAL SYMBOLS.]—3. In *geol.*, where one bed supplies the place of another, which, in that situation, is wanting, such bed is called the *equivalent* of the wanting one.

EQUIV'ALENTLY, *adv.* In an equal manner.

E'QUIVALVE, *a.* [L. *æquus*, equal, and *valva*, the leaf of a folding door.] In *conchol.*, when the shells of bivalves are formed exactly alike, in their length, width, depth, &c., they are termed *equivalve*. The shells of mya, solen, tellina, &c. are generally *equivalve*, while those of ostrea are *inequivalve*.

EQUIV'OCACY,† *n.* Equivocalness.

Being of doubtful signification; that may be understood in different senses; capable of a double interpretation; ambiguous; as, *equivocal* words, terms, or senses. Men may be misled in their opinions by the use of *equivocal* terms. Strictly speaking, there is hardly a word in any language which may not be regarded as, in some degree, *equivocal*; but the term, in *logic*, is usually applied only in any case where a word is *employed* equivocally; *e. g.* where the middle term is used in different senses in the two premises; or where a proposition is liable to be understood in various senses, according to the various meanings of one of its terms.—2. Doubtful; ambiguous; susceptible of different constructions; not decided. The character of the man is somewhat *equivocal*. His conduct is *equivocal*. -3. Uncertain; proceeding from some unknown cause, or not from the usual cause. *Equivocal* generation is the production of animals without the intercourse of the sexes, and of plants without seed: a doctrine now exploded.

EQUIV'OCATE, *v. i.* [It. *equivocare*; Fr. *équivoquer*. *See* EQUIVOCAL.] To use words of a doubtful signification; to express one's opinions in terms which admit of different senses; to use ambiguous expressions. To *equivocate* is the dishonourable work of duplicity. The upright man will not *equivocate* in his intercourse with his fellow-men.

EQUIV'OCATING, *ppr.* Using ambiguous words or phrases.

EQUIVOCA'TION, *n.* Ambiguity of speech; the use of words or expressions that are susceptible of a double signification. Hypocrites are often guilty of *equivocation*, and by this means lose the confidence of their fellow-men. *Equivocation* is incompatible with the Christian character and profession.

The leading requisite of a good escapement is that the impulse communicated to the pendulum shall be invariable, notwithstanding any irregularity or foulness in the train of wheels. Various kinds of escapements have been contrived; such as the *crown escapement*, used in common watches; the *anchor escapement*, used in common clocks — both these are also termed *recoiling escapements* — the *dead-beat escapement*, used in the finer kind of clocks; the *detached escapement*, and the *lever escapement.* Both these last are applied to the finer kind of watches.

EVAPORA'TION, *n.* The conversion of a fluid into vapour or steam, which becomes dissipated in the atmosphere in the manner of an elastic fluid. The process of evaporation is constantly going on at the surface of the earth, but principally at the surface of the sea, of lakes, rivers, and pools. The vapour thus formed, in consequence of its being specifically lighter than atmospheric air, rises to considerable heights above the earth's surface; and afterwards, by a partial condensation, forms clouds, and finally descends in rain. The quantity of vapour raised up into the air by evaporation is sufficient to afford all the rain that falls, or to supply all the springs, and of consequence, all the rivers derived from them on the surface of the earth. Heat is the principal cause of evaporation, but it is also promoted by winds and other causes. The effect of evaporation is to reduce the temperature of the evaporating surface. In the animal body evaporation from the skin and lungs is one of the most obvious causes of diminution of temperature.—2. The act of flying off in fumes; vent; discharge.—3. In *phar.*, the operation of drawing off a portion of a fluid in steam, that the remainder may be of a greater consistence, or more concentrated.—*Artificial evaporation* is a process made use of in chemistry. It is usually performed by applying heat to any compound substance, in order to dispel the volatile parts. It differs from distillation, its object being chiefly to preserve the more fixed matters, while the volatile substances are allowed to escape. Hence, evaporation is commonly made to take place in open shallow vessels, and distillation in an apparatus nearly closed from the external air.

The precise time when *evening* begins, or when it ends, is not ascertained by usage. In *strictness, evening* commences at the setting of the sun, and continues during twilight, and *night* commences with total darkness. That which elucidates and enables the mind to see truth; proof arising from our own perceptions by the senses, or from the testimony of others, or from inductions of reason. Our senses furnish *evidence* of the existence of matter, of solidity, of colour, of heat and cold, of a difference in the qualities of bodies, of figure, &c. The declarations of a witness furnish *evidence* of facts to a court and jury; and reasoning, or the deductions of the mind from facts or arguments, furnish *evidence* of truth or falsehood.—*Evidence* has been distinguished into *intuitive* and *deductive*. [*See* INTUITIVE and DEDUCTIVE.] *Intuitive evidence* is of three kinds. 1. The evidence of axioms. 2. The evidence of consciousness, of perception, and of memory. 3. The evidence of those fundamental laws of human belief which form an essential part of our constitution; and of which our entire conviction is implied not only in all our speculative reasonings, but in all our conduct as active beings. These fundamental laws have by some been termed *prin-*

ciples of common sense. *Deductive evidence* is of two kinds, *demonstrative* and *probable;* the former relating to *necessary,* the latter to *contingent* truths. Mathematical evidence is of the demonstrative kind. *Probable evidence* is founded on a belief that the course of nature will continue to be in time to come, as it has been in time past. The *evidence of testimony* is another species of evidence. *Evidence* in jurisprudence denotes the means by which facts are ascertained for judicial purposes. In relation to this subject, evidence is in its nature divided into two sorts. 1. *Direct* and *positive.* 2. *Presumptive* and *circumstantial.* In respect to the mode or instruments of proof, it is again divided into two sorts. 1. *Written evidence.* 2. *Unwritten* or *oral evidence.* The *evidences* of revelation are divided into *internal* and *external.* The *internal* are those which arise from the consideration of the declarations and doctrines contained in it; and the external are those which arise from other circumstances referring to it, such as prophecies, miracles, the lives and character of the inspired writers, &c. —2. Any instrument or writing which contains proof.

I delivered the *evidence* of the purchase to Baruch; Jer. xxxii.

I subscribed the *evidence* and sealed it; Jer. xxxii.

It now consists of two divisions; one of which exercises jurisdiction in all cases relating to the customs and excise, and over revenue matters generally. The other is a court of common law, in which all personal actions may be brought. A third division, for the trial of causes in equity, was abolished by the 5 Vict. c. 5. The court was further regulated by the 5 and 6 Vict. c. 86. The judges are four: the lord chief baron, and three inferior barons. An appeal lies from their decisions to the courts of queen's bench and common pleas, sitting in the exchequer chamber.—*Exchequer bills*, in *England*, bills for money, or promissory bills, issued from the exchequer; a species of paper currency emitted under the authority of the government and bearing interest. Exchequer bills form a principal part of the public unfunded debt of Great Britain.—The *court of exchequer*, in *Scotland*, was originally the king's revenue court. It was established on its present footing in the reign of Queen Anne. The judges are the high treasurer of Great Britain, with a chief baron and four barons, who must be either serjeants at law, or English barristers, or Scotch advocates of five years' standing. By the act of Queen Anne, the court was allowed a privative jurisdiction as to the duties of customs, excise, or other revenues appertaining to the king, and as to all honours and estates which may accrue to the crown. The barons were also empowered to pass the accounts of sheriffs, and other officers who have the execution of writs issuing from, or returnable to, the court of exchequer, and to receive resignations of lands, and to pass signatures of charters, tutories, and other gifts of casualties, &c. By a recent act, however, the powers of the barons of the Scotch exchequer, as to the duties and revenues, &c., have ceased, and their duties are now performed by a judge of the court of session.

All bodies expand in all their dimensions by the application of heat, and contract their dimensions when the heat is withdrawn from them, or their temperature diminished. In different bodies, the degree of expansion is different, some expanding more and more rapidly than others with the same degree of heat. Solid bodies expand least; liquids expand more and more rapidly than solids; and air and gases expand more and more rapidly than liquids. In solids and liquids, the expansions are progressive, that is, they expand more in higher temperatures than in lower, with equal additions of heat. In air and gaseous substances the expansions are equable at all temperatures. The expansions of solid bodies are ascertained by pyrometers, and those of fluids by thermometers.—3. Their motion. *Milton.*

[This sense, though often used by Gibbon, seems to be obsolescent.]—2. We *expect* money will be paid at the time it is due, though we are often disappointed.—*Expect*, in its legitimate sense, always refers to a *future* event. Thus when a grant of land is made to A. for twenty years, and after the determination of that term, to B. and his heirs for ever; A. is tenant for years, remainder to B. in fee. In this case, the estate of B. is in *expectancy*, that is, waiting for the determination of the estate for years. A reversion is the residue of an estate left in the grantor, to commence in possession after the determination of a particular estate granted out by him. As when A. leases an estate to B. for twenty years; after the determination of that period, the estate *reverts* to the lessor, but during the term the estate of the lessor is in *expectancy*.

EXPECTA'TION, *n.* [L. *expectatio*.] 1. The act of expecting or looking forward to a future event with at least some reason to believe the event will happen. *Expectation* differs from *hope*. *Hope* originates in desire, and may exist with little or no ground of belief that the desired event will arrive. *Expectation* is founded on some reasons which render the event probable. *Hope* is directed to some good; *expectation* is directed to good or evil.

The same weakness of mind which indulges absurd *expectations*, produces petulance in disappointment. *Irving.*

We now more generally say, a youth of *promise*.—6. In *chances*, *expectation* is applied to contingent events, and is reducible to computation. A sum of money in expectation, when an event happens, has a determinate value before that event happens. If the chances of receiving or not receiving a hundred pounds, when an event arrives, are equal; then, before the arrival of the event, the expectation is worth half the money. —*Expectation of life;* a term applied to the mean or average duration of the life of individuals of any given age.

We see the root of these words is to go, to *fare*, to drive, urge, or press, to strain or stretch forward.] 1. Trial, or a series of trials or experiments; active effort or attempt to do or to prove something, or repeated efforts. A man attempts to raise wheat on moist or clayey ground; his attempt fails of success; *experience* proves that wheat will not flourish on such a soil. He repeats the trial, and his *experience* proves the same fact. A single trial is usually denominated an *experiment; experience* may be a series of trials, or the result of such trials.—2. Observation of a fact, or of the same facts or events happening under like circumstances.—3. Trial from suffering or enjoyment; suffering itself; the use of the senses; as, the *experience* we have of pain or sickness. We know the effect of light, of smell, or of taste, by *experience.* We learn the instability of human affairs by observation or by *experience.* We learn the value of integrity by *experience.* Hence,—4. Knowledge derived from trials, use, practice, or from a series of observations. *Experience*, in its strict sense, applies to events which have taken place within a person's own knowledge. In this sense it, of course, relates to the past alone. But more frequently the word is used to denote that judgment which is derived from experience in the primary sense, by reasoning from that, in combination with other data. Thus, a man may assert on the ground of experience, that the tide may always be expected, under such circumstances, to rise to such a height. Strictly speaking, this cannot be known from experience, but is a conclusion derived from experience. It is in this sense only that *experience* can be applied to the future, or, which comes to the same thing, to any general fact, as when it is said that we know by experience that water exposed to a certain temperature will freeze. In the use of the word, we must distinguish between our own *personal* experience and *general* experience.—*Contrary to experience;* speaking strictly, that only is contrary to a man's experience, which he knows by experience not to be true; but in a different and looser sense, a miracle, or any other event, may be called contrary to the *experience* of any one who has never witnessed the like, as the freezing of water was to that of the king of Bantam.

EXPE'RIENCE, *v. t.* To try by use, by suffering, or by enjoyment. Thus we all *experience* pain, sorrow, and pleasure; we *experience* good and evil; we often *experience* a change of sentiments and views.—2. EXPER'IMENT, *n.* [L. *experimentum*, from *experior*, as in *experience*—which *see.*] A trial; an act or operation designed to discover some unknown truth, principle, or effect, or to establish it when discovered. *Experiments* in chemistry disclose the qualities of natural bodies. A series of *experiments* proves the uniformity of the laws of matter. It is not always safe to trust to a single *experiment.* It is not expedient to try many *experiments* in legislation.

> A political *experiment* cannot be made in a laboratory, nor determined in a few hours. *J. Adams.*

In *physical science*, experiments are of the utmost importance. By means of experiment we put nature into new and convenient situations, in which she could not otherwise appear to us, and we are thus enabled to observe her operations upon a small scale; we can, for instance, by the aid of a suitable electrical apparatus, exhibit upon a small scale the phenomena and effects of lightning, and examine them in detail with minuteness and accuracy. The history of physical science since the commencement of the present century strikingly demonstrates how powerful an instrument *experiment* is in the discovery of facts.—*Experimentum crucis; a crucial experiment*, one which is decisive of the question at issue, and confirms or disproves at once.

EXPER'IMENT, *v. i.* To make trial; to make an experiment; to operate on a body in such a manner as to discover some unknown fact, or to establish it when known. Built on experiments; founded on trial and observations, or on a series of results, the effects of operations.—*Experimental philosophy*, that philosophy which proceeds on experiments; which deduces the laws of nature, and the properties and powers of bodies and their actions upon each other from sensible experiments. It is otherwise termed natural philosophy, mechanical philosophy, or physics.—4. Taught by experience; having personal experience.

EX'PIATE, *v. t.* [L. *expio; ex* and *pio*, to worship, to atone; *pius*, pious, mild. The primary sense is probably to *appease*, to pacify, to allay resentment, which is the usual sense of *atone* in most languages which I have examined. *Pio* is probably contracted from *pico*, and from the root of *paco*, the radical sense of which is to lay, set, or fix; the

F.

F, the sixth letter of the English Alphabet, is a labial articulation, formed by placing the upper teeth on the under lip, and accompanied with an emission of breath. Its kindred letter is *v*, which is chiefly distinguished from *f* by being more vocal, or accompanied with more sound, as may be perceived by pronouncing *ef*, *ev*. This letter may be derived from the Oriental ו *vau*, or from פ *pe* or *phe*; most probably the former. The Latins received the letter from the Eolians in Greece, who wrote it in the form of a double γ (*g*,) Ϝ, whence it has been called most absurdly digamma. It corresponds in power to the Greek φ *phi*, and its proper name is *ef*. As a Latin numeral it signifies 40, and with a dash over the top, F̄ forty thousand. In *the civil law*, two of these letters together, *ff*, signify the pandects. In *English criminal law*, this letter was branded on felons, when admitted to the benefit of clergy; by stat. 4 H. VII. c. 13. In *medical prescriptions*, F. stands for *fiat*, let it be made; F. S. A. *fiat secundum artem*. F. stands also for *Fellow*; F. R. S. Fellow of the Royal Society. F or *fa*, in *music*, is

FALCO'NIDÆ, *n.* Leach's name for a family of *raptorial birds* or birds of prey. In this family the destructive power is most perfectly developed, and we find in the birds composing it, natural instruments for striking, trussing, and dissecting their prey, combined with a power of flight and strength of limbs equivalent to the necessities of the case, whether it be the habit of the raptorial bird in question to strike down its prey while in the act of flight or to capture it upon the ground. The true falcons are inferior in size to the eagles and vultures, but they are of all birds the most symmetrical in their form, and the most courageous and daring in the capture of their prey. They are distinguished by a projection over the eye-brows, which gives their eyes the appearance of being deeply seated in their orbits. The beak is hooked and generally curved from its origin; there are three toes before and one behind, the claws are pointed and sharp, movable, retractile, and much hooked. The family includes the different species of eagles, the hawks and falcons properly so called.

Ch. Syr. and Sam. to fall. *Fail* agrees better with the Heb. נבל, *nabal* and הבל, *habal,* but these words may have had one primitive root, the sense of which was to move, to recede, to pass. As these words are unquestionably the same in the Shemitic and Japhetic languages, they afford decisive evidence that נ or the first letter of the Shemitic words is a prefix. FALL, *n.* The act of dropping or descending from a higher to a lower place by gravity; descent; as, a *fall* from a horse or from the yard of a ship. All bodies on the earth, by virtue of the attraction of gravitation, tend toward the centre of the earth. If this tendency acts freely, the body falls toward the earth in the direction of its centre, if it is opposed, pressure ensues; if the tendency is partly checked and partly efficient, pressure and descent both ensue. The velocity of a body falling by gravity is uniformly accelerated; the velocity acquired at any part of the descent is directly as the time which the body has occupied in its descent, to acquire that velocity;—in other words, the velocities acquired are as the times of descent, also the spaces described are directly as the squares of the times, and directly as the squares of the velocities. A body during the first second of its fall describes a space equal to $16\frac{1}{12}$ feet. Hence, in order to ascertain the space through which a body would fall in any given number of seconds, multiply the square of the number of seconds by $16\frac{1}{12}$, or, in round numbers, by 16, and the answer will be obtained in feet.—2. When the descent is moderate, we name it *rapids*. Custom however sometimes deviates from this rule, and the *rapids* of rivers are called *falls*.—11. The outlet or discharge of a river or current of water into the ocean, or into a lake or pond; as, the *fall* of the Po into the Gulf of Venice. —12. The same object has frequently two images, one in the natural, and the other in an inverted position. The images of a single object are said to be sometimes considerably multiplied. Those of them who lived in the apostolic age, or were, during any part of their lives, contemporary with the apostles, are called *apostolic fathers*. These are five: Clement of Rome, Barnabas, Hermas, Ignatius, and Polycarp. Those of the first three centuries, including the five above named, are sometimes styled *primitive fathers*, to distinguish them from the *fathers* of the fourth and fifth centuries,—their names are Clement of Rome, Barnabas, Hermas, Ignatius, Polycarp, Justin, Theophilus, bishop of Antioch, Irenæus, bishop of Lyon, Clement of Alexandria, who died about A. With Augustin the list of the great *fathers* of the church is generally considered as terminating, the more eminent subsequent prelates and theologians, as Bernard, Thomas Aquinas, &c., being generally distinguished by the name of *doctors of the church*. The study of the *fathers* is interesting, not only to theologians, but to those who would examine carefully the philosophy and the state of society in their time.—*Adoptive father*, he who adopts the children of another, and acknowledges them as his own.—*Natural father*, the father of illegitimate children. —*Putative father*, one who is only reputed to be the father; the supposed father.

FEE, *n.* [Sax. *feo, feoh;* G. *vieh;* Scot. *fee, fey*, or *fie*, cattle; L. *pecu, pecus.* From the use of cattle in transferring property, or from barter and payments in cattle, the word came to signify money; it signified also goods, substance in general. But the primary sense is not obvious.] A reward or compensation for services; recompense, either gratuitous, or established by law and claimed of right. It is applied particularly to the reward of professional services; as, the *fees* of lawyers and physicians; the *fees* of office; clerk's *fees;* sheriff's *fees;* marriage *fees*, &c. Many of these are fixed by law; but gratuities to professional men are also called *fees.*

FEE, or **FIEF**, *n.* [This word is usually deduced from Sax. *feoh*, cattle, property, and *fee*, a reward. This is a mistake. *Fee*, in *land*, is a contraction of *feud* or *fief*, or from the same source; It. *fede*, Sp. *fe*, faith, trust. *Fee*, a reward, from *feoh*, is a Teutonic word; but *fee, feud, fief*, are words wholly unknown to the Teutonic nations, who use, as synonymous with them, the word, which, in *English*, is *loan.* This word, *fee*, in land or an estate in trust, originated among the descendants of the northern conquerors of Italy, but it originated in the south of Europe. *See* FEUD.] Primarily, a loan of land, an estate in trust, granted by a prince or lord, to be held by the grantee on condition of personal service, or other condition; and if the grantee or tenant failed to perform the conditions, the land reverted to the lord or donor, called the *landlord*, or *lend-lord*, the lord of the loan. A fee then is any land or tenement held of a superior on certain conditions. It is synonymous with *fief* and *feud.* All the land in England, except the Crown land, is of this kind. Fees are absolute or limited. An *absolute fee* or *fee-simple* is land which a man holds to himself and his heirs for ever, who are called *tenants in fee-simple.* Hence in *modern times*, the term *fee* or *fee-simple* denotes an estate of inheritance; and in *America*, where lands are not generally held of a superior, a *fee* or *fee-simple* is an estate in which the owner has the whole property without any condition annexed to the tenure. A *limited fee* is an estate limited or clogged with certain conditions; as, a *qualified* or *base fee*, which ceases with the existence of certain conditions; and a *conditional fee* which is limited to particular heirs. In *the United States*, an estate in *fee* or *fee-simple* is what is called in English law an allodial estate, an estate held by a person in his own right, and descendible to the heirs in general.

It is by *feeling* we know that a body is hard or soft, hot or cold, wet or dry, rough or smooth. It is the most universal of all the senses. It exists wherever there are nerves, and they are everywhere, where there is life. Were it otherwise the parts divested of it might be destroyed without our knowledge. Hence in French, *félon* is traitorous, rebellious. So the word is explained and deduced in Gregoire's Armoric Dictionary. FEL'ONY, *n.* [*See* FELON.] In *common law*, any crime which incurs the forfeiture of lands or goods. All offences punishable with death are felonies; and so are some crimes not thus punished, as suicide, homicide by chance-medley, or in self-defence, and petty larceny. Capital punishment, therefore, does not necessarily enter into the true idea or definition of felony; the true criterion of felony being forfeiture of lands or goods. But the idea of felony has been so generally connected with that of capital punishment, that law and usage now confirm that connection. Thus if a statute makes any new offence a felony,

it is understood to mean a crime punishable with death.

3. That which causes fermentation, as yeast, barm, or fermenting beer. Ferment or yeast is nothing but vegetable fibrine, albumen, or caseine in a state of decomposition or putrefaction, the atoms of which are in a continual motion. The presence of nitrogen or azote seems essential in the composition of ferments; hence, they are classed by chemists among azotized compounds. Of all the bodies convertible into yeast during fermentation, vegetable gluten and albumen possess the most rapid and energetic powers.

FERMENT', *v. i.* To work; to effervesce; to be in motion, or to be excited into sensible internal motion, as the constituent particles of an animal or vegetable fluid. FERMENTA'TION, *n.* [L. *fermentation* The sensible internal motion of the constituent particles of animal and vegetable substances, occasioned by a certain degree of heat and moisture, and accompanied by an extrication of gas and heat. It is nothing else but the putrefaction of a substance containing no nitrogen; that is to say, a metamorphosis by which the elements of a complex molecule or atom-group themselves, so as to form more intimate and more stable compounds according to the special attractions of these elements. Thus *fermentation* produces a change of properties in the substances fermented, arising from new combinations of their principles. It is excited by the contact of all bodies the elements of which are in a state of active

decomposition. In nitrogenized substances of a very complex constitution, putrefaction or fermentation is spontaneously established when water is present, and when the temperature is sufficiently high; substances containing no nitrogen, on the contrary, require, in order to their undergoing this metamorphosis, the presence of a nitrogenized substance, already in a state of putrefaction (fermentation). The substances which best promote the change are gliadine, gluten, vegetable albumen, in short, all substances in a state of spontaneous decomposition, to which the general name of ferment is given. It is of three kinds; the *vinous* fermentation, producing alcohol; the *acetous*, in which alcohol and other substances are converted into vinegar; the *putrefactive*, which characterizes particularly the decomposition of azotized organic substances. Some chemists distinguish two other species of fermentation, viz., the *saccharine*, in which starch and gum are converted into sugar; the *viscous* or *mucilaginous*, in which sugar is converted into slime or a sirupy mucilage, instead of alcohol. Some writers, also, give to the process of raising bread the name of *panary fermentation*. Fermentation differs from effervescence. The former is confined to animal and vegetable substances; the latter is applicable to mineral substances. The former is spontaneous; the latter produced by the mixture of bodies.

The stem is the common foot-stalk or rather the middle rib of the leaves, so that most ferns want the stem altogether. The ferns constitute the first order of cryptogams, in the sexual system. The total number of living species of ferns is about 1500. The large tree ferns are confined almost exclusively to the tropics. Immense fossil arborescent ferns, from thirty to forty feet in height, are found in the coal formation. Among our rude ancestors, these quarrels, though originating in the murder of an individual, involved the whole tribe or family of the injured and of the aggressing parties. Hence in *modern usage*,—2. A contention or quarrel; particularly, an inveterate quarrel between families or parties in a state; the discord and animosities which prevail among the citizens of a state or city, sometimes accompanied with civil war. In *the north of Great Britain*, the word is still used in its original sense; denoting a combination of kindred to revenge the death of any of their blood, on the offender and all his race, or any other great enemy. We say, it is the policy of our enemies to raise and cherish intestine *feuds.* The word is not strictly applicable to wars between different nations, but to intestine wars, and to quarrels and animosities between families or small tribes.

FEUD, *n.* [Usually supposed to be composed of the Teutonic *fee*, goods, reward, and *ead* or *odh*, W. *eizaw*, possession, property. But if feuds had been given as rewards for services, that consideration would have vested the *title* to the land in the donee. Yet *feud* is not a Teutonic or Gothic word, being found among none of the northern nations of Europe. This word originated in the south of Europe. It probably originated among the Franks, or in Lombardy or Italy, and certainly among men who studied the civil law. In Italian, a feoffee is called *fede-commessario*, a trust-commissary; *fede-commesso*, is a feoffment, a trust-estate; Sp. *fideicomiso*, a feoffment. These words are the *fidei-commissarius, fidei-commissum*, of the Digest and Codex. In Spanish *fiado* signifies security given for another or bail; *al fiado*, on trust; *fiador*, one who trusts; *feudo*, a fief, fee, or feud; Port. *id.* In Norman, *fidz* de chevalers signifies knight's fees.—*Feud*, then, and *fee*, which is a contraction of it, is a word formed from the L. *fides*, It. *fede*, Sp. *fe*, Norm. *fei*, faith, trust, with *had*, state, or *ead* or *odh*, estate; and a *feud* is an estate in trust, or on condition, which coincides nearly in sense with the northern word, G. *lehen*, D. *leen*, Sw. *län*, Dan. *lehn*, Eng. *loan.* From the origin of this word, we see the peculiar propriety of calling the donee *fidelis*, and his obligation to his lord *fidelitas*, whence *fealty.*] A fief; a fee; a right to lands or hereditaments held in trust, or on the terms of performing certain conditions; the right which a vassal or tenant has to the lands or other immovable thing of his lord, to use the same and take the profits thereof hereditarily, rendering to his superior such duties and services as belong to military tenure, &c., the

property of the soil always remaining in the lord or superior. From the foregoing explanation of the origin of the word, result very naturally the definition of the term, and the doctrine of forfeiture, upon non-performance of the conditions of the trust or loan.

It exists in chyle; it enters into the composition of blood; of it the chief part of muscular flesh is formed; and hence it may be regarded as the most abundant constituent of the soft solids of animals. Fine arts, or polite arts, are the arts which depend chiefly on the labours of the mind or imagination, and whose object is pleasure; as poetry, music, painting, and sculpture. The uses of this word are so numerous and indefinite, as to preclude a particular definition of each. In general, *fine*, in *popular language*, expresses whatever is excellent, showy, or magnificent.

FINE, *n.* [This word is the basis of *finance*, but we have not found it, in its simple form, in any modern language, except the English. Junius says that *ffin*, in Cimbric, is a mulct, and *ffinio*, to fine. The word seems to be the L. *finis*, and the application of it to pecuniary compensation seems to have proceeded from its feudal use, in the transfer of lands, in which a *final* agreement or concord was made between the lord and his vassal.] 1. In *a feudal sense*, a final agreement between persons concerning lands or rents, or between the lord and his vassal, prescribing the conditions on which the latter should hold his lands.—2. A sum of money paid to the lord by his tenant, for permission to alienate or transfer his lands to another. The *fine* or *fine of lands*, in *law*, was one of the modes of conveying lands and hereditaments by matter of record. It was so called because it put an end not only to the actual suit of which it was the conclusion, but also to all other suits and controversies concerning the same matter. Divested of its technicalities, a *fine* may be described to be an amicable composition or agreement of a suit either actual or fictitious, by leave of the king or his justices, whereby the lands in question become, or are acknowledged to be, the right of one of the parties. This mode of conveyance was abolished by the statute 3 and 4 William IV., yet the rules by which it was governed form a very considerable branch of real property law.—3. A sum of money paid to the king or state by way of penalty for an offence; a mulct, a pecuniary punishment. *Fines* are usually prescribed by statute, for the several violations of law; or the limit is prescribed, beyond which the judge cannot impose a *fine* for a particular offence.

A luminous fluid proceeding from burning bodies and from the combustion of their volatile particles. Flame is attended with great heat, and sometimes with the evolution of much light; but the temperature may be intense when the light is feeble, as is the case with the flame of burning hydrogen gas. According to Sir H. Davy, the flame of combustible bodies must be considered as the combustion of an explosive mixture of inflammable gas or vapour, and air; and that towards the interior of the flame, as of a candle, lamp, or gas jet, combustion goes on, proving that oxygen is mixed with the whole of the burning vapour. But according to other chemists the internal part of the flame is comparatively cool, the actual combustion being diffused over the surface and concentrated at the apex of the flame.—2. spect to structure, it is an assemblage of several whorls or series of leaves more or less modified in their form and texture, and situated in the manner of a bud at the extremity of the peduncle. In the state in which the flower presents itself in the more perfect dicotyledonous plants it is composed of an outer verticil of leaves, the *calyx*; an inner verticil of a more delicate texture, the *corolla*; within this, the *stamens*; and in the centre, the *pistil* or *ovary*, inclosing the seeds. [*See these terms.*] The point of attachment of the flower is named the *receptacle* or *torus*. Many flowers have no calyx, and others neither calyx nor corolla. All the monocotyledonous plants are destitute of a corolla.—*Flower buds*, buds which produce only flowers, in distinction from leaf-buds, which give rise to branches bearing leaves only.—*Pedunculate flower*, one supported by a flower stalk or peduncle.—*Sessile flower*, one without a peduncle.—*Fertile* or *female flower*, one having pistils.—*Male* or *sterile flower*, one having stamens only.—*Hermaphrodite* or *perfect flower*, one having stamens and pistils. [*See* INFLORESCENCE.]—*Artificial flowers*, imitations of natural flowers, worn as ornaments in the hair, in bonnets, &c.—2. In *vulgar acceptation*, a blossom or flower is the flower-bud of a plant, when the petals are expanded; open petals being considered as the principal thing in constituting a flower. But in *bot.*, the petals are now considered as a finer sort of covering, and not at all necessary to constitute a flower.—3. Liquids have been also termed *non-elastic fluids*, for although they are not altogether void of elasticity, they possess it only in a small degree. Air and aeriform bodies have been called elastic fluids on account of their great elasticity. [*See* HYDROSTATICS, HYDRAULICS, and PNEUMATICS.]

FLUOBOR'IC, *a.* The *fluoboric* acid or gas is a compound of fluorine and *boron*. It is a colourless gas, has a penetrating pungent odour, and extinguishes flame on the instant. It forms salts with alkalies, which are termed *fluoborates*. It has a singularly great affinity for water. It may be prepared by heating a strong solution of hydrofluoric and boracic acids in a metallic retort.

FLU'OR, *n.* [Low L. from *fluo*, to flow.] 1. A fluid state.—2. Menstrual flux. [*Lit. us. in either sense.*]—3. In *mineralogy*, fluoride of calcium, usually called fluor-spar. It commonly occurs massive; but crystallizes in octahedrons, which are frequently changed into cubes. It is a mineral of beautiful colours, and much used for ornamental vessels. The variously coloured specimens, called Derbyshire-spar, are worked, upon the turning lathe, into vases and other ornamental objects. Of this material the original myrrhine vessels of the ancients were made.

FLUOR'IC, *a.* Pertaining to fluor; obtained from fluor.—*Fluoric acid*, an acid prepared by mixing fluor spar in coarse powder with twice its weight of sulphuric acid, in a leaden or silver retort, and applying heat. It possesses exceedingly destructive properties. It destroys the skin almost immediately if applied to it, producing very painful wounds. It even corrodes glass and silicious bodies, especially when hot, and the thickest glass vessel can only withstand its action for a short time.

FLU'ORIDE, *n.* Fluorides are compounds of fluorine with the metals or electro-positive elements; thus fluor-spar, which consists of fluorine and calcium, is *fluoride of calcium*.

FLU'ORIN, } *n.* An element in the
FLU'ORINE, } form of a yellowish brown gas, with the odour of chlorine and burnt sugar; one of the acidifying and basifying principles. It has been only lately procured in an insulated state, if indeed as much as this can be said. It appears to be a gas of a yellowish brown colour, and like chlorine it has the power of destroying colour. It has a powerful affinity for metallic bodies, and for hydrogen. The compounds which contain fluorine, when they do not possess acid properties, are termed *Fluorides*.

FLU'OR SPAR, *n.* A common mineral product found in great beauty in Derbyshire; hence it is known in this country under the name of the Derbyshire-spar. It is generally crystallized in cubes, but its primitive form is an octahedron. It is of various colours, and often beautifully banded, especially when in nodules, which are much prized for the manufacture of vases, and occasionally used for beads, brooch-stones, and other ornamental purposes. It is probably a compound of fluorine and calcium, hence a *fluoride of calcium*. The term *fluor* is derived from the fusibility of this substance, on which account it is sometimes used as a flux to promote the fusion of certain refractory minerals. It is manufactured, at Matlock and Derby, into a great variety of articles.

FLUOSIL'ICATE, *n.* [*fluor* and *silex* or *silica*.] In *chem.*, a compound of fluosilicic acid with some base.

In *fluxions*, magnitudes are supposed to be generated by motion; a line by the motion of a point, a surface by the motion of a line, and a solid by the motion of a surface. And some part of a figure is supposed to be generated by a uniform motion, in consequence of which the other parts may increase uniformly, or with an accelerated or retarded motion, or may decrease in any of these ways, and the computations are made by tracing the comparative velocities with which the parts flow. A *fluxion* is an infinitely small quantity, an increment; the infinitely small increase of the fluent or flowing quantity. The doctrine of fluxions, first invented by Newton, is of great use in the investigation of curves, and in the discovery of the quadratures of curvilinear spaces and their rectifications. The whole doctrine consists in solving the two following problems, viz. 1. From the fluent or variable flowing quantity given to find the fluxion; which constitutes the direct method of fluxions. 2. From the fluxion given to find the fluent; which constitutes the inverse method of fluxions. [*See* DIFFERENTIAL.]

In *zool.*, a genus of birds, the Muscicapa, of the order of Passeres, with a bill flatted at the base, almost triangular, notched at the upper mandible, and beset with bristles. The birds which constitute this genus are exceedingly numerous, and have given rise to great difficulties as to their scientific arrangement; no two authors agreeing in their ideas on the subject. They are widely distributed over the globe, abounding where insects are most numerous, and are of great use in destroying those numerous swarms of noxious insects engendered by heat and moisture which are continually on the wing. The habits of these birds are taciturn, solitary, and untamable. They perch on the highest branches of trees, where they watch for insects, and take them on the wing with great quickness.

FLY'-WHEEL, *n.* In *mech.*, a wheel with a heavy rim, placed on the revolving shaft of any machinery put in motion by an irregular or intermitting force, for the purpose of rendering the motion equable and regular by means of its momentum. This effect results from a law of nature that all bodies have a tendency to continue in their state either of motion or of rest, until acted upon by some extraneous force. Thus the rim of a fly-wheel, after a few revolutions, acquires a momentum sufficient to cause it to revolve with a velocity depending upon the resistance of the machinery, and the augmentations and diminutions of the impelling power succeeding each other rapidly, while neither cause acts sufficiently long to either augment or diminish the velocity acquired in any considerable degree; and hence it remains equable or nearly so. A fly-wheel is often used as an accumulator of force; thus, when a small steam-engine sets in motion a very large fly-wheel, the wheel acts as a reservoir of all the small pressures which have been communicated to it, and having thus concentrated them can apply them altogether and at once, when some great effect is to be produced.

There is a constant ascent of watery particles from the surface of the earth occasioned by the evaporation from masses of water and moist bodies; and when the air is saturated with vapour, the watery particles which continue to rise are no longer dissolved, but remain suspended in vesicular vapours, which form clouds when they rise to a great height, and fogs when they hover near the surface of the earth. Fogs are more frequent at those seasons of the year when there is a considerable difference of temperature in the different parts of the day.—2. A cloud of dust or smoke.

FOOD, *n.* [Sax. *fod*, *foda*; G. *futter*; Sw. *föda*, from *feeding*. *See* FEED.] 1. In *a general sense*, whatever is eaten by animals for nourishment, and whatever supplies nutriment to plants.—2. Meat; aliment; flesh or vegetables eaten for sustaining human life; victuals; provisions; whatever is or may be eaten for nourishment.

Feed me with *food* convenient for me; Prov. xxx.

All substances susceptible of digestion and assimilation may come under the denomination of food, but the proximate principles of organic bodies on which their nutritive powers depend are comparatively few. Hence, although the articles employed in different countries for the support of animal life are almost infinitely various, their sustaining powers may be referred to certain substances, capable of being separated and identified by chemical analysis and tests. Amongst the proxi-

mate elements of vegetable food, gluten, and its modifications, starch, gum, sugar, and lignine, or woody fibre, are by far the most important; and amongst those of animal food, albumen, gelatine, and their modifications, together with fats and oils, which are common to both kingdoms of nature. According to Liebig, the substances of which the food of man is composed may be divided into two classes; *nitrogenized*, and *non-nitrogenized*. The former are capable of conversion into blood; the latter incapable of this transformation. Out of the first class are formed all the organized tissues; those of the other class serve to support the process of respiration, and to maintain the animal heat. Among the former class are reckoned vegetable fibrin, vegetable albumen, vegetable caseine, animal flesh, animal blood. Among the second class are fat, starch, gum, sugar, sugar of milk, wine, beer, spirits.—3. Whatever supplies nourishment and growth to plants, as water, carbonic acid gas, &c. Manuring substances furnish plants with *food*. The food of vegetables, as far as their organic structure is concerned, consists entirely of inorganic compounds; and no organized body can serve for the nutrition of vegetables until it has, by the process of decay or putrefaction, been resolved into certain inorganic substances. These are carbonic acid, water, and ammonia. But even where these are supplied to vegetables, their growth will not proceed unless certain mineral substances are likewise furnished in small quantities either by the soil, or in the water used to moisten it. These mineral substances consist of silica, potash, phosphate of lime, magnesia, soda, sulphates, and oxide of iron.—4. Something that sustains, nourishes, and augments. Flattery is the *food* of vanity.

FOR, *prep.* [Sax. *for* or *fore;* D. *voor*, for and before; G. *für* and *vor;* Sw. *för;* Dan. *for, för;* Ir. *far;* Fr. *pour;* Sp. and Port. *por, para;* It. *per*, which unites *for* and L. *per*, and if this is the same word, so is the Fr. *par*. Indeed *far* seems to be radically the same word; for the Germans and Dutch use *ver*, far, in composition, in the same manner, and in the same words, as the English, Danes, and Swedes use *for*. Thus Ger. *verbieten*, D. *verbieden*, Dan. *forbyder*, Sw. *förbinda*, are all the same word, Eng. to *forbid*. The French use *par*, as we use *for*, in *pardonner*, to pardon, to *forgive*, It. *perdonare*. Arm. *par* and *pour*, in composition; Hindoo, *para;* Pers. *bar* or *ber*, and *behr*. *For* corresponds in sense with the L. *pro*, as *fore* does with *præ*, but *pro* and *præ* are probably contracted from *prod*, *præd*. The Latin *por* in composition, as in *porrigo*, is probably contracted from *porro*, Gr. πορρω, which is the English *far*. The Gr. περα, and probably, περι, περαν, are from the same root. The radical sense of *for* is to go, to pass, to advance, to reach or stretch; and it is probably allied to the Sax. *faran*, to *fare*, W. *for*, a pass, *foriaw*, to travel.—*To go toward*, to *meet* or *turn to*, is the primary sense of *for*, in two of its most common uses; one implying *opposition*, *against;* the other, a *favour* or *benefit;* or *for* may be from *fore*, hence opposite. To sell or exchange a hat *for* a guinea, is to set or pass one *against* the other; this is the primary sense of all prepositions which are placed before equivalents in sale and barter.—*Benefit* or *favour* is expressed by *moving toward* a person, or by advancing him. This present is *for* my friend; this advice *for* his instruction. And in *the Old Testament*, the *face* or front is taken for *favour*. *For*, in *some phrases*, signifies *during*, that is, *passing*, continuing in time. I will lend a book *for* a day or a month. In *composition*, *for* is used to give a negative sense, as in *forbid*, which is *forebid*, to command *before*, that is, *against*, and in *forgive*, to give back or away, to remit, to send back or to send away.] 1. Against; in the place of; as, a substitute or equivalent, noting equal value or satisfactory compensation, either in barter and sale, in contract, or in punishment. "And Joseph gave them bread in exchange *for* horses, and *for* flocks, and *for* the cattle of the herds;" that is, according to the original, he gave them bread *against* horses, like the Gr. αντι and Fr. *contre;* Gen. xlvii. 17.

> Buy us and our land *for* bread; Gen xlvii 19.

> And if any mischief follow, then thou shalt give life *for* life, eye *for* eye, tooth *for* tooth, hand *for* hand, foot *for* foot; Exod xxi.

> As the Son of man came not to be ministered to, but to minister, and to give his life a ransom *for* many; Matt. xx See also Mark viii. 37, Matt. xvi. 26.

2. In the place of; instead of; noting substitution of persons, or agency of one in the place of another with equivalent authority. An attorney is empowered to act *for* his principal. Will you take a letter and deliver it *for* me at the post-office? that is, in my place, or for my benefit.—3. In exchange of; noting one thing taken or given in place of another; as, to quit the profession of law *for* that of a clergyman. —4. In the place of; instead of; as, to translate a poem line *for* line.—5. In the character of; noting resemblance; a sense derived from substitution or standing in the place of, like αντι in Greek.

Against; in opposition to; with a tendency to resist and destroy; as, a remedy *for* the head-ache or tooth-ache. Alkalies are good *for* the heart-burn. And, *for* the time shall not seem tedious. *Shak*
This use is nearly obsolete. The sense however is derived from meeting, opposing, as in No. 12.—14. Because; on account of; by reason of. He cried out *for* anguish. I cannot go *for* want of time. *For* this cause, I cannot believe the report

So we say, *for* me, *for* myself, or as *for* me, I have no anxiety, but *for* you I have apprehensions; all implying *toward* or *on the side of*.—16. Through a certain space; during a certain time; as, to travel *for* three days; to sail *for* seven weeks; he holds his office *for* life: he travelled on sand *for* ten miles together. These senses seem to imply *passing*, the proper sense of *for*.—17. In quest of; in order to obtain; as, to search *for* arguments; to recur to antiquity *for* examples. [*See* No. 11.]—18. According to; as far as.

[No. 1.]—31. *For to*, denoting purpose. *For* was anciently placed before the infinitives of verbs, and the use is correct, but now obsolete except in vulgar language. I came *for* to see you; *pour vous voir.*

FOR, *con.* The word by which a reason is introduced of something before advanced. "That ye may be the children of your Father who is in heaven; *for* he maketh his sun to rise on the evil and on the good." In such sentences, *for* has the sense of *because, by reason that*, as in No. 14; with this difference, that in No. 14, the word precedes a single noun, and here it precedes a sentence or clause; but the phrase seems to be elliptical, *for this cause or reason, which follows*, he maketh his sun to rise, &c. In Romans xiii. 6, we find the word in both its applications, "*For, for* this cause ye pay tribute also;" the first *for* referring to the sentence following; the latter to the noun *cause*.—2. Because; on this account that; properly, *for that*.—*For as much*, compounded *forasmuch*, is equivalent to, in regard to that, in consideration of. *Forasmuch* as the thirst is intolerable, the patient may be indulged in a little drink.—*For why*, Fr. *pour quoi*, [*per quod, pro quo*,] because; for this reason.

FOR, as a prefix to verbs, has usually the force of a negative or privative, denoting *against*, that is, *before*, or *away, aside*. Horne Tooke accounts for this Saxon prefix in the following manner,—"From the Latin *fores, foris*, the French had *fors;* and of the French *fors*, our ancestors, by their favourite pronunciation of *th*, made *forth*. *Fors*, in the preposition and conjunctive use of it, the French have latterly changed to *hors*, but they have not so changed it when in composition. From the French we have many English words preceded by *for* with this meaning; as *forfeit, forclose*, (*foreclose*,) &c., and we had anciently many more." Hence *for* prefixed to such words is equivalent to—out, through-out, thoroughly, utterly, extremely; or to—to, out, out of, off, away. *For*, however, is sometimes a corruption of *Fore*, as *Fore* is often used where the original prefix was *For*.

FOR'AGE, *n.* [Fr. *fourrage.* If this word signifies primarily food or fodder, it is connected with W. *pori*, to feed, and L. *voro.* But may it not be from the root of Sax. *faran*, to go, and primarily to signify that which is collected in wandering, roving, excursion? In Port. *foragido* is a vagabond, and *forrejar* is to waste, to ravage.] 1. Food of any kind for horses and cattle, as grass, pasture, hay, oats, &c.—2. The act of providing forage.

FORCE, *n* [Fr. *force;* from L. *fortis.* All words denoting force, power, strength, are from verbs which express straining, or driving, rushing, and this word has the elements of Sax. *faran,* and L. *vireo.*] 1. Strength; active power; vigour; might; energy that may be exerted; that physical property in a body which may produce action or motion in another body, or may counteract such action. By the *force* of the muscles we raise a weight, or resist an assault.—2. Momentum; the quantity of power produced by motion or the action of one body on another; as, the *force* of a cannon ball.—3. That which causes an operation or moral effect; strength; energy; as, the *force* of the mind, will, or understanding.—4. Violence; power exerted against will or consent; compulsory power. Let conquerors consider that *force* alone can keep what *force* has obtained.—5. Strength; moral power to convince the mind. There is great *force* in an argument.—6. Virtue; efficacy. No presumption or hypothesis can be of *force* enough to overthrow constant experience.—7. Validity; power to bind or hold. If the conditions of a covenant are not fulfilled, the contract is of no *force.* A testament is of *force* after the testator is dead; Heb. ix. 17.—8. Strength or power for war; armament; troops; an army or navy; as, a military or naval *force;* sometimes in the plural; as, military *forces.*—9. Destiny; necessity; compulsion; any extraneous power to which men are subject; as, the *force* of fate or of divine decrees.—10. Internal power; as, the *force* of habit.—11. In *law,* any unlawful violence to person or property. This is *simple,* when no other crime attends it, as the entering into another's possession, without committing any other unlawful act. It is *compound,* when some other violence or unlawful act is committed. The law also implies force, as when a person enters a house or inclosure lawfully, but afterward does an unlawful act. In *this case,* the law supposes the first entrance to be for that purpose, and therefore by force.—*Physical force* is the force of material bodies.—*Moral force* is the power of acting on the reason in judging and determining.—*Mechanical force* is the power that belongs to bodies at rest or in motion. The pressure or tension of bodies at rest is called a *mechanical force,* and so is the power of a body in motion. There is also the *force* of gravity or attraction, centrifugal and centripetal *forces,* expansive *force,* &c. Force in its most general and comprehensive sense, denotes whatever produces a change in the state of a body. Any exertion which, if. applied to a body, has a tendency to move that body when at rest, or to affect or stop its progress, if already in motion, is termed a *force,* and is sometimes called an *active force* in contradistinction to what merely resists or retards the motion of another, but is itself apparently inactive. Forces may be of different kinds, but they are all compared and measured by the quantities of motion which they respectively produce in a given time; in fact we know nothing whatever of forces excepting through their effects. The degree of resistance to any motion may be measured by the active force required to overcome that resistance, and hence writers on mechanics make use of the terms *resisting forces* and *retarding forces.* When two forces act on a body in the same *line of direction,* the resulting force, or *resultant* as it is called, will be the sum of both forces. If they act in opposite directions, the body will remain at rest if the forces be equal; or, if the forces be unequal, it will move with a force equivalent to their difference in the direction of the greater. If the lines of direction make an angle with each other, the resultant will be a mean force in an intermediate direction.—*Composition of forces,* the combining of two or more forces into one which shall have the same effect when acting in some given direction.—*Resolution of forces,* the decomposing of a single force into two or more forces, which, acting in different directions, shall be equivalent to the single force. The fundamental proposition of the composition of forces is as follows:—Any two forces acting at the same point, and represented in magnitude and direction by two straight lines, are equivalent to a third force which is represented in magnitude and direction by the diagonal of the parallelogram constructed with the two lines as its sides. Thus, let a body at A be

acted upon by two forces at the same instant, one of which would cause it to move over the line AB in a given time, and the other acting alone, would cause it to move over the line AC in the same time; then the direction of the motion resulting from the action of both forces will be that of the diagonal AD of the parallelogram AB DC, and at the end of the given time the body will be found at D. The diagonal AD represents the resultant of the forces in the directions AB and

AC, and is equivalent to them both. By means of this proposition the resultant of any number of forces whatever may be found, and also, any given force may be resolved into two others, such that the straight lines by which they are represented form the two sides of a parallelogram, of which the line representing the given force is the diagonal. The proposition is frequently termed the *parallelogram of forces*, and is of great importance in mechanical science. Forces have different denominations according to their nature and the manner in which they act; thus, we have *accelerating forces, central forces, constant forces, parallel forces, uniform and variable forces*, &c. [*See* these terms in their proper places.] —*Moving force* or *motive force*; the same as *momentum*.—*Permanent force*, that which acts constantly; thus, the action of a weight suspended from a cord, or resting on a surface, is a permanent force.—*Impulsive force*, that which is applied suddenly to a body and immediately ceases to act upon it, as the blow of a hammer or percussion.—*Animal force*, that which results from the muscular power of men, horses, and other animals.—*Line of direction of a force*, the straight line in which any force tends to make a body move. Similar forces acting on a body cause it to move in a straight line, but if the forces be dissimilar, the body will move in a curve line depending on the nature of the forces. Thus, a cannon ball is acted on by the impulse of the charge, and by the force of gravity, and in consequence of these two dissimilar forces, describes the curve of a parabola.—*Polygon of forces*. [*See* POLYGON.]—*Unit of force*, the single force in terms of which the amount of any other force is ascertained, and which is generally some known weight, as a pound.—*Equilibrium of forces*, any number of forces, which being applied to a body, destroy one another's tendency to communicate motion to it, and thus hold it at rest.—*Forces, impressed and effective*. [*See* VIRTUAL VELOCITIES.]

By the *ancient laws of England*, a man *forfeited* his estate by neglecting or refusing to fulfil the conditions on which it was granted to him, or by a breach of fealty. A man now *forfeits* his estate by committing treason. A man *forfeits* his honour or reputation by a breach of promise, and by any criminal or disgraceful act. Statutes declare that by certain acts a man shall *forfeit* a certain sum of money. Under the feudal system, the right to the land *forfeited* vested in the lord or superior. In *modern times*, the right to things *forfeited* is generally regulated by statutes; it is vested in the state, in corporations, or in prosecutors or informers, or partly in the state or a corporation, and partly in an individual. The duellist, to secure the reputation of bravery, *forfeits* the esteem of good men, and the favour of heaven.

FOR'FEIT, *n*. (for'fit.) [Fr. *forfait*; W. *forfed*; Low L. *forisfactura*. Originally, and still in French, a trespass, transgression, or crime. In regard to property, forfeiture is a loss of the right to possess, but not generally the actual possession, which is to be transferred by some subsequent process. In *the feudal system*, a forfeiture of lands gave him in reversion or remainder a right to enter. *Forfeiture* is either civil or criminal. In *civil cases*, when a tenant in tail, for example, makes leases, not warranted by the statute, a forfeiture is committed, and he who has the immediate reversion, may enter upon possession. In *criminal cases*, it is two-fold; of real and personal estates, as by attainder in high treason; or, in petty treason and felony, of all chattel interests absolutely, and the profits of all freehold estates during life and after death, of all lands and tenements in fee-simple (but not those in tail), to the crown for a year and a day, &c.—2. Small forges, consisting of a little furnace, or simply of a bellows so placed as to cast a stream of air upon ignited coals, are of various forms and uses. A common forge consists of the hearth or fireplace, which is merely a cavity in masonry or brick-work well lined with fire clay or brick, upon which the ignited fuel is placed, and upon the back or side of which a powerful blast of air is driven in through the muzzle of a double-blasted bellows, which is commonly worked by a hand-lever. The most common mode in which forgery is committed is to counterfeit the name of another person, but the crime may be complete without this, as for instance, when a person antedates a deed, for the purpose of defrauding other parties, though he signs his own name to the document. *Formerly* this crime was punishable by death, but by a late act, the punishment of death is abolished, and a punishment, varying between transportation for life and imprisonment for two years, is substituted.—3. That which is forged or counterfeited.

his entry or seizure. More properly, a *freehold* is an estate in lands or tenements, in fee-simple, or in tail, for the term of the life of the holder, or for the life of another person, in dower or by the courtesy. *Freehold* is also extended to such offices as a man holds in fee or for life. According to its own peculiar language, it is founded on the practice of social and moral virtue. It claims the character of charity, in the most extended sense; and brotherly love, relief, and truth are inculcated in it. The first societies of antiquity with which *free masonry* appears to stand in historical connection, are the corporations of architects, which, with the Romans, existed under the names of *Collegia* and *Corpora*, first established in the time of Numa. These are of one family, unless there has been a change of letters. The Italian has *fregio*, for frieze, and the Gr. φρισσω had for its radical letters φρξ. These may be of a different family. To *freeze* is to contract. Qu. Russ. *mroz*, frost.] 1. To be congealed by cold; to be changed from a liquid to a solid state by the abstraction of heat; to be hardened into ice or a like solid body. It takes place by the effect of natural cold in many liquids, and most of them may be frozen by an artificial reduction of temperature. The process of freezing is always attended with the emission of heat, and at the same time the bulk of the body is increased. Water in the act of freezing shows a prodigious expansive power, capable of bursting rocks asunder, and thick shells of metal.—*Freezing point*. That point in a thermometer at which the included mercury, or other fluid, stands, when the instrument is immersed in another fluid that is in the act of freezing, is called the *freezing point* of the latter. The *freezing point* varies greatly in different fluids. In *Fahrenheit's thermometer*, the *freezing point* of water is 32°, of milk 30°, of mercury 39° below zero, and of sulphuric ether 46° below zero. —*Freezing mixtures* or *frigorific mixtures*, such mixtures as produce a degree of cold sufficient to freeze liquids. A very great degree of cold is produced by mixing snow with certain salts. A mixture of muriate of lime and dry light snow, will freeze mercury in a few minutes. Diluted sulphuric acid and snow produce a degree of cold which sinks the thermometer to 91° below zero.

FRIC'TION, *n.* [L. *frictio*; Fr. *friction*; from L. *frico*, to rub.] 1. The act of rubbing the surface of one body against that of another; attrition. Many bodies by *friction* emit light, and *friction* generates or evolves heat.—2. In *mech.*, the effect of rubbing, or the resistance which a moving body meets with from the surface on which it moves.—*Friction* arises from the roughness of the surface of the body moved on, and that of the moving body. No such thing can be found as perfect smoothness of surface in bodies. In every case there is, to a less or greater extent, a roughness or unevenness of the parts of the surface, arising from peculiar texture, porosity, and other causes, and therefore when two surfaces come together the prominent parts of the one fall into the cavities of the other. This tends to prevent or retard motion, for in dragging the one body over the other an exertion must be used to lift the prominences over the parts which oppose them. *Friction* is therefore a retarding force capable of destroying, but incapable of generating motion. It acts as a retarding influence in the action of all mechanical contrivances, and a due allowance must in every case be made for it. However small it may be, it sooner or later causes the wearing down and destruction of mechanism, and therefore forms an insurmountable obstacle to the long duration of the materials of which machines are composed. Coulomb and Ximenes, from a series of experiments on the friction of bodies sliding on each other, were led to the following conclusions. 1. Friction is a uniformly retarding force. 2. For moderate velocities the resistance due to friction in bodies of the same kind is a constant quantity, and is very nearly the same for all velocities; but in heterogeneous bodies, as wood and metal, the friction increases very sensibly with an increased velocity. 3. Friction is greatest between bodies whose surfaces are rough, and is diminished by polishing them. 4. It is greater between surfaces of the same material than between those of heterogeneous bodies. 5. When the rubbing surfaces remain the same, the friction increases directly as the pressure. 6. When the pressure remains the same, the friction is not increased by increasing the surfaces in contact. 7. Friction requires time to attain its maximum, in some cases five or six days. 8. When a rope is more than once wound round a cylinder, the friction or resistance increases in a geometrical progression, while the number of turns increases in an arithmetical progression. The conclusions relative to the friction of rolling bodies are nearly the same as those regarding sliding bodies, except that, in the former case, the friction is far inferior in amount.—*Coefficient of friction*, the ratio that exists between the pressure and the friction in a body moving down an inclined plane. It is expressed by the tangent of the angle of inclination of the plane. Friction is one of the most effectual means of lessening, controlling, or arresting motion, and in this way is of great importance in many cases. It is indispensable in the economy of nature and in many processes of art, and it becomes a matter of great importance to be acquainted with its laws, to know how to increase it where it is required, and how to diminish it when it acts as an obstacle to mechanical motions. Its effects may be diminished in various ways, such as smoothing the rubbing surfaces by means of polishing and unctuous substances, and by particular mechanical arrangements. When one body slides over another the friction is much greater than when the one is made to roll upon the other, and hence one mode of diminishing friction is to convert a sliding motion into a rolling motion, such as that of wheel carriages.—*Friction* wheels are a contrivance for diminishing friction. In these, each end of the axis of a wheel is made to turn, not in a groove, but on the circumferences of two wheels, every one movable on its own axis.—3. It is a mechanical contrivance for equalizing the power of the main-spring; for as the action of a spring varies with its distance from the quiescent position, the power derived from the force of a spring requires to be modified according to circumstances, before it can become a proper substitute for a uniform power. In order therefore to correct this irregular action of the main-spring the fusee on which the chain or catgut acts is made somewhat conical, so that its radius at every point may be adapted to the strength of the spring.

G

G, the seventh letter and the fifth articulation of the English Alphabet, is derived to us, through the Latin and Greek, from the Assyrian languages; it being found in the Chaldee, Syriac, Hebrew, Samaritan, Phenician, Ethiopic, and Arabic. In the latter language, it is called *giim* or *jim;* but in the others, *gimel, gomal,* or *gamal,* that is, *camel,* from its shape, which resembles the neck of that animal, at least in the Chaldee and Hebrew. It is the third letter in the Chaldee, Syriac, Hebrew, Samaritan, and Greek; the fifth in the Arabic, and the twentieth in the Ethiopic. The Greek Γ *gamma* is the Chaldaic ג inverted. The early Latins used C for the Greek *gamma,* and hence C came to hold the third place in the order of the Alphabet; the place which *gimel* holds in the oriental languages. The two letters are primarily palatals, and so nearly allied in sound that they are easily convertible; and they have been reciprocally used the one for the other. But in the Assyrian languages, *gimel* had two sounds; one close, as we pronounce the letter in *gave, good;* the other compound, as the English *j,* or as *ch* in *chase.* In the Arabic, this letter has the sound of the English *j* or *dzh,* and this sound it has in many English words, as in *genius, gem, ginger.* It retains its close sound in all cases, before *a, o,* and *u;* but before *e, i,* and *y,* its sound is close or compound, as custom has dictated, and its different sounds are not reducible to rules. It is silent in some words before *n,* as in *benign, condign, malign, campaign;* but it resumes its sound in *benignity* and *malignity.* G is mute before *n* in *gnash, gnaw;* it is silent also in many words when united with *h,* as in *bright, might, night, nigh, high.* The Saxon *g* has in many words been softened or liquefied into *y* or *ow;* as Sax. *dæg, gear,* Eng. *day, year;* Sax. *bugan,* Eng. to *bow.* The Celtic nations had a peculiar manner of beginning the sound of *u* or *w* with the articulation *g,* or rather prefixing this articulation to that vowel. Thus *guard* for *ward, gwain* for *wain, guerre* for *war, gwell* for *well.* Whether this *g* has been added by the Celtic races, or whether the Teutonic nations have lost it, is a point which would admit of doubt, but is worth some inquiry. As a *numeral,* G was anciently used to denote 400, and with a dash over it, Ḡ, 40,000. As a Roman abbreviation G is used for *gratis, gens, gaudium,* &c. G. V. or U. signifies *genio urbis,* G. L. *genio loci.* In English it is used for grand, as G.C.B. (Knight of the) Grand Cross of the Bath, &c. In *chronology,* it is the seventh dominical letter. In *music,* it is the mark of the treble clef, and from its being placed at the head or marking the first sound in Guido's scale, the whole scale took the name, *Gamut,* from the Greek name of the letter.

GA, in Gothic, is a prefix, answering to *ge* in Saxon and other Teutonic languages. It sometimes has the force of the Latin *cum* or *con,* as in *gawithan,* to conjoin. But in most words it appears to have no use, and in modern English it is entirely lost. *Y-cleped,* in which *ge* is changed into *y,* is the last word in which the English retained this prefix.

GAB, *n.* [Scot *gab,* Dan. *gab,* the mouth, and a *gap* or gaping; Russ. *guba,* a lip, a bay, or gulf, the mouth of a river; Ir. *cab,* the mouth; connected probably with *gabble, gibberish,* Sax. *gabban,* to mock, perhaps to make mouths. *See* GABBLE and GAPE.] The mouth; loquacity; as in the phrase, the gift of the *gab.* The word and phrase are vulgarisms in English, but are much used among the common people of Scotland.

GALL, *n.* [L. *galla*; Sax. *gealla.*] A hard round excrescence produced by the cynips, a small insect, which deposits its eggs in the tender shoots of the Quercus infectoria, a species of oak, abundant in Asia Minor, Syria, Persia, &c. When the maggot is hatched, it produces a morbid excrescence of the surrounding parts. *Galls* are inodorous, and have a nau-

seously bitter and astringent taste. They are nearly spherical, and vary in magnitude, from the size of a pea to that of a hazel-nut. When good, they are of a black or deep olive colour. They are also termed *nut-galls* or *gall-nuts*, and are known, in *com*, by the names of *white, green,* and *blue*. The two latter kinds are the best. The chief products of *galls*, are tannin and gallic acid. They are very extensively used in dyeing, and in the manufacture of ink. They are the most powerful of all the vegetable astringents, and are frequently used in medicine. They are chiefly imported from Aleppo, Tripoli, Smyrna, and Said. *Galls* are also produced, though of inferior quality, on the other species of oak, and likewise on plants and trees of different kinds, as *berry galls, apple galls,* &c. The same name is given to any protuberance or tumour, produced by the puncture of insects on plants and trees of different kinds. These *galls* are of various forms and sizes.

GALVAN'IC, *a.* Pertaining to galvanism; containing or exhibiting it, as *galvanic* action, *galvanic* influence.—*Galvanic circle.* If between two plates of different metals, a fluid be interposed which has a chemical effect on one of the metals, and little or none upon the other; and if a communication be made between other parts of the plates by means of a conducting substance, as a wire, a continual current of electricity will be produced through the conductor from one plate to the other as long as the chemical action is exerted. This is the simple *galvanic circle*. A number of similar pairs of plates placed alternately above one another with an acting fluid intervening between each, and the two ends of the series connected with a wire, multiplies the effect, and is called a *galvanic* or *voltaic pile*, and constitutes a *compound galvanic circle*. The end of the galvanic pile which gives out the electric fluid is called the *positive pole* or *positive electrode*, and the other end in which the wire terminates, and which receives the electric matter, is called the *negative pole* of the pile or *negative electrode*. Galvanic circles

may also be constructed by a series of plates arranged in a circle, or in a line; also several upright piles may be joined together so as to multiply the effects of a single pile.—*Galvanic trough* or *battery*. This arrangement consists of a trough divided into numerous compartments by partitions, the whole being made of non-conducting materials. Into these compartments are let down square plates of zinc and copper, previously united together in pairs by soldering each pair, enclosing a space between them so as to form a cell for the liquid by which the combination is to be made active. The annexed figure represents an improved form of galvanic battery, in which the plates are detached instead of being soldered together. They are connected at the upper edge by a metallic arc.

GAL'VANISM, *n.* [from *Galvani* of Bologna, the discoverer.] Electrical phenomena in which the electricity is developed without the aid of friction, and in which a chemical action takes place between certain bodies. It includes all those electrical phenomena arising from the chemical agency of certain metals with different fluids. Volta discovered the means of multiplying those effects; hence the science has also been called *voltaism*, or *voltaic electricity;* and (from its action on the muscles of animals newly killed), *animal electricity*. The galvanic battery or pile, is an instrument of vast power, and admits of extensive application in the wide field of chemical research, and accordingly the acquisition of it has led to important discoveries. The electricity produced by the galvanic battery is much less intense than that produced by an ordinary electrical machine, but it possesses this great advantage, that its action may be kept up for any length of time, in a continuous manner; whereas in a highly charged electric battery, the whole of the electric power is expended as soon as the circuit is completed. The effects of galvanism may be distinguished into the three classes of physiological, chemical, and physical. With respect to the physiological effects, we may refer to the marvellous cures said to have been effected by currents of electricity—to the facts recorded of animals recently killed, exhibiting many of the signs of life, so long as they are placed between the poles of the pile. Animals stupefied by breathing the fumes of charcoal, may be brought at once to life by placing them between the poles of the pile. Among the chemical effects produced by the galvanic pile, the decomposition of water, of oxides, and the alkalies, are the most remarkable. Among the physical effects, we may remark the production of heat, light, and magnetism. This last effect, and the mutual action which the currents exert on each other, constitutes the science of electro-magnetism. Galvanism is heat, light, electricity, and magnetism, united in combination or in simultaneous action; sometimes one and sometimes another of them predominating, and thus producing more or less all the effects of each: usual means of excitement, contact of dissimilar bodies, especially of metals and fluids. [*See* VOLTAIC ELECTRICITY.]

This name has been adopted by modern chemists to distinguish permanent aeriform fluids generally from common atmospheric air, which is a mixture of two species of gas. *Gases* are distinguished from *liquids* by the name of *elastic* fluids; while liquids are termed *non-elastic*, because they have, comparatively, no elasticity. But the most prominent distinction is the following:—*Liquids* are compressible to a certain degree, and expand into their former state when the pressure is removed; and in so far they are elastic, but *gases* appear to be in a continued state of compression; for when left unconfined, they expand in every direction to an extent which has not hitherto been determined. *Gases* retain their elasticity in all ordinary temperatures, and in this they differ from vapours. A number of them, however, by being subjected to the joint influence of excessive cold and pressure, have been reduced to the solid state. The number of gaseous bodies is great, and they differ greatly in their chemical properties. They are all, however, susceptible of forming combinations with fluid and solid substances. Many of them are of great importance in the arts and manufactures, and one, viz., coal gas, or carburetted hydrogen, has contributed immensely to the comfort and convenience of our cities and towns. Gases are invisible except when coloured, which happens in two or three instances.

It is confined to the solid parts of the body, such as tendons, ligaments, cartilages, and bones, and exists nearly pure in the skin, but it is not contained in any healthy animal fluid. Its leading character is the formation of a tremulous jelly when its solution in boiling water cools. Gelatine does not exist as such in the animal tissues, but is formed by the action of boiling water. The coarser forms of gelatine from hoofs, hides, &c., are called *glue;* that from skin and finer membranes, is called *size;* and the purest gelatine, from the air-bladders and other membranes of fish, is called *isinglass.* With tannin, a yellowish white precipitate is thrown down from a solution of gelatine, which forms an elastic adhesive mass, not unlike vegetable gluten, and is a compound of tannin and gelatine. It is this action of tannin on gelatine that is the foundation of the art of tanning leather. Gelatine when acted upon by sulphuric acid, yields *gelatine sugar* or glycicoll. When treated with potash it is said to yield glycicoll and leucine. Gelatine is nearly related to proteine, but contains none of that substance. It is a nutritious article of food, and as part of the diet in hospitals produces the best effects, but animals fed exclusively on it die with the symptoms of starvation, as it cannot yield albumen, fibrine, or caseine. Its ultimate components are 47.8 carbon, 7.9 hydrogen, 16.9 nitrogen, 27.4 oxygen. [*See* JELLY.]

As a science, geography includes the doctrine or knowledge of the astronomical circles or divisions of the sphere, by which the relative position of places on the globe may be ascertained; and usually treatises of geography contain some account of the inhabitants of the earth, of their government, manners, &c., and an account of the principal animals, plants, and minerals.—*General or universal geography*, the science which conveys a knowledge of the earth, both as a distinct and independent body in the universe, and as connected with a system of heavenly bodies.—*Mathematical geography*, that branch of the general science which is derived from the application of mathematical truths to the figure of the earth, and which teaches us to determine the relative positions of places, their longitudes and latitudes, the different lines and circles imagined to be drawn upon the earth's surface, their measure, distance, &c.—*Physical geography*, that which gives a description of the principal features of the earth's surface, the various climates and temperatures, showing how these, together with other causes, affect the condition of the human race, and also a general account of the animals and productions of the globe.—*Political geography*, that branch which considers the earth as the abode of rational beings, according to their diffusion over the globe, and their social relations as they are divided into larger or smaller societies.—*Sacred* or *biblical geography*, the geography of Palestine, and other oriental nations mentioned in Scripture, having for its object the illustration and elucidation of scripture history.—2. It also investigates the successive changes that have taken place in the organic and inorganic kingdoms of nature; it inquires into the causes of these changes, and the influence which they have exerted in modifying the surface and external structure of our planet. It is a science founded on exact observation and careful induction, and is intimately connected with all the physical sciences. The geologist, in order that he may conduct his investigations with success, ought to be well versed in chemistry, mineralogy, zoology, botany, comparative anatomy; in short, every branch of science relating to organic and inorganic nature. Within the memory of the present generation, the science of geology has made immense progress. Aided not only by the higher branches of physics, but by recent discoveries in mineralogy and chemistry, in botany, zoology, and comparative anatomy, it has extracted from the archives of the interior of the earth, records of former conditions of our planet, and deciphered documents which were a sealed book to our ancestors. It extends its researches into regions more vast and remote than come within the scope of any other physical science except astronomy, of which it has emphatically been termed the sister science. ĠEOM'ETRY, n. [Gr. γεωμετρια: γη, the earth, and μετρεω, measure.] Originally and properly, the art of measuring the earth, or any distances or dimensions on it. But geometry now denotes the science of magnitude in general, comprehending the doctrines and relations of whatever is susceptible of augmentation and diminution; as, the mensuration of lines, surfaces, solids, velocity, weight, &c., with their various relations. Geometry is the most general and important of the mathematical sciences; it is founded upon a few axioms or self-evident truths [see AXIOM], and every proposition which it lays down, whether it be theorem or problem, is subjected to the most accurate and rigid demonstration. Its usefulness extends to almost every art and science. Astronomy, navigation, surveying, architecture, fortification, engineering, perspective, drawing, optics, mechanics, &c., all depend upon it.—*Geometry* has been distinguished into theoretical or *speculative* and *practical*. The former treats of the various properties and relations of magnitudes, with demonstrations of theorems, &c.; and the latter relates to the performance of certain geometrical operations, such as the construction of figures, the drawing of lines in certain positions, and the application of geometrical principles to the various measurements in the ordinary concerns of life.—*Theoretical geometry* is again divided into *elementary* or *common geometry*, and the higher geometry; the former being employed in the consideration of lines, superficies, angles, planes, figures, and solids; and the latter, in the consideration of the higher order of curve lines and problems.—*Descriptive geometry*. [See under DESCRIPTIVE.]

GET, *v. t. pret. got,* [*gat,* obs.] *pp. got, gotten.* [Sax. *getan, gytan,* or *geatan,* to get; *agytan,* to know or understand; *angitan, andgitan,* to find, to understand. The Danish has *forgietter,* to forget, but *gitter* signifies to *guess,* or to suppose, to think; the Swedish also has *förgäta,* to forget, to give to oblivion, *ex animo ejicere.* The simple verb *gietter, gäta,* coincides with the D. *gieten,* G. *giessen,* to *cast,* to pour out, to found, as vessels of metal, Sax. *geotan.* To *get,* then, is primarily, to throw, and with respect to acquisition, it is to rush on and seize. The Italian has *cattare,* to get; *raccattare,* to regain, to acquire. Qu. Sp. *rescatar,* Port. *resgatar,* to redeem, to ransom. *See* RESCUE.] 1. To procure; to obtain; to gain possession of, by almost any means. We *get* favour by kindness; we *get* wealth by industry and economy; we *get* land by purchase; we *get* praise by good conduct; and we *get* blame by doing injustice. The merchant should *get* a profit on his goods; the labourer should *get* a due reward for his labour; most men *get* what they can for their goods or for their services. *Get* differs from *acquire,* as it does not always express permanence of possession, which is the appropriate sense of *acquire.* We *get* a book or a loaf of bread by borrowing, we do not *acquire* it; but we *get* or *acquire* an estate.—2. To have.

Thou hast *got* the face of a man. *Herbert.*

This is a most common, but gross abuse of this word. We constantly hear it said, I have *got* no corn, I have *got* no money, she has *got* a fair complexion, when the person means only, I have no corn, I have no money, she has a fair complexion.—3. To beget; to procreate; to generate.—4. To learn; as, to *get* a lesson.—5. To prevail on; to induce; to persuade.

Though the king could not *get* him to engage in a life of business. *Spectator.*

[*This is not elegant.*]—6. To procure to be. We could not *get* the work done. [*Not elegant.*]—*To get off,* to put off; to take or pull off; as, to *get off* a garment; also, to remove; as, to *get off* a ship from shoals.—2. To sell; to dispose of; as, to *get off* goods.—*To get on,* to put on; to draw or pull on; as, to *get on* a coat; to *get on* boots.—*To get in,* to collect and shelter; to bring under cover; as, to *get in* corn.—*To get out,* to draw forth; as, to *get out* a secret.—2. To draw out; to disengage.—*To get the day,* to win; to conquer; to gain the victory.—*To get together,* to collect; to amass.—*To get over,* to surmount; to conquer; to pass without being obstructed; as, to *get over* difficulties; also, to recover; as, to *get over* sickness.—*To get above,* to surmount; to surpass.—*To get up,* to prepare and introduce upon the stage; to bring forward. With a pronoun following, it signifies to betake; to remove; to go; as, *get* you to bed; *get* thee out of the land. But this mode of expression can hardly be deemed elegant.

They are thought to have emigrated about A D 1408 or 1409, when Timur Beg ravaged India for the purpose of spreading the Mahometan religion. They must certainly have been in Egypt before they reached us, otherwise it is incomprehensible how the report arose that they were Egyptians. *Brand's Popular Antiquities.*

The French call them *Bohémiens*, because they first immigrated to France from Bohemia, in the 15th century. In Italy they are called *zingari*, in Spain *gitanos*, in Germany *zigeuner*. These heaps of stones, which are deposited ultimately at the lower termination of the glacier, are called *moraines*. GLAND, *n.* [L. *glans*, a nut; *glandula*, a gland; Fr. *glande*. Qu. Gr. βαλανος, with a different prefix.] 1. In *anat.*, a distinct soft body, formed by the convolution of a great number of vessels, either constituting a part of the lymphatic system, or destined to secrete some fluid from the blood. Glands have been divided into *conglobate* and *conglomerate*, from their structure; but a more proper division is into *lymphatic* and *secretory*. The former are found in the course of the lymphatic vessels, and are conglobate. The latter are of various structure. They include the mucous follicles, the conglomerate glands, properly so called, such as the parotid glands and the pancreas, the liver, kidneys, &c. The term has also been applied to other bodies of a similar appearance, neither lymphatic nor secretory; such as the thymus and thyroid glands, whose use is not certainly known, certain portions of the brain, as the pineal and pituitary glands, &c. [*See* CONGLOBATE and CONGLOMERATE.]—2. In *bot.*, a *gland* or *glandule* is an excretory or secretory duct or vessel in a plant. Glands are peculiar organs which are observed on almost every part of a plant, and whose function it is to separate from the general mass of the sap of the plant some particular fluid or substance. They appear to be formed of a very delicate cellular tissue in which a great number of vessels are ramified But this name has also been given to vesicular bodies which are often transparent and placed in the substance of organs, and are full of a volatile oil which has been probably secreted in their interior. Their peculiar form and structure are very various, and hence they have been distinguished into several species. Thus, there are *miliary glands*, which are small and superficial, appearing under the form of small round grains disposed in regular series, or scattered without order on all parts of the plant exposed to the air; *vesicular glands*, small reservoirs full of essential oil, and lodged in the herbaceous integument of vegetables, as in the leaves of the myrtle and orange; *globular glands*, which are of a spherical form, adhering to the epidermis only by a point They are observed particularly in the *labiatæ*; *utricular glands* or *ampullæ*, which are filled with a colourless fluid, as in the ice-plant; *papillary glands*, something like the papillæ of the tongue. They occur in many of the *labiatæ*; *lenticular glands*, which are of a round depressed form, and appear peeping through the cuticle of the stem of the common willow and other similar plants. Some of these are borne upon stalks, others *sessile*, or attached to the plant without any appendage. *Lenticular glands*, however, do not appear to have any function connected with secretion, but seem rather to be the rudiments of roots which never develope themselves.

Tacitus, de Mor. Ger. 45, mentions *glesum*, amber collected in the Baltic, probably the same word, and so named from its clearness. Greenness is usually named from vegetation or growing, as L. *viridis*, from *vireo.*] 1. A hard, brittle, transparent factitious substance, formed by the fusion of silicious matter, such as powder-flint or fine sand, together with some alkali, alkaline earth, salt, or metallic oxide. The nature of the glass depends upon the quality and proportion of the ingredients of which it is

formed; and thus an infinite variety of different kinds of glass may be manufactured; but, in *commerce*, five kinds only are recognised, viz.:—1. Bottle, or coarse green glass. 2. Broad, or coarse window glass. 3. Crown-glass, or the best window glass. 4. Plate-glass, or glass of pure soda. 5. Flint-glass, or glass of lead. The principal ingredients used for the production of each of these kinds of glass are silex, or flint, and an alkali. The differences in the various kinds result from the description of alkali employed, and from the addition of certain necessary materials, usually metallic oxides. The great utility of glass is well known. Its physical properties are of the highest importance. Although exceedingly brittle when cold, yet, by the application of a high degree of heat, it may be rendered so flexible and tenacious, that it may with the utmost facility be moulded into any form. It is so ductile when heated that it may be spun into filaments of the greatest conceivable fineness, and these when cold are pliant and elastic in a high degree. The principal seat of the glass manufacture in England is at Newcastle-upon-Tyne and the neighbouring town of Shields. There are also large glass-works at St. Helens, in Lancashire. In 1845, the glass manufacture of Great Britain was relieved from the payment of duty and excise interference.—*Soluble glass*, a silicate of potash or soda in which the alkali predominates.—2. In *chem.*, a substance or mixture, earthy, saline, or metallic, brought by fusion to the state of a hard, brittle, transparent mass, whose fracture is conchoidal.—3. A disease in the eye, in which the crystalline humour becomes of a bluish or greenish colour, and its transparency is diminished. An opacity of the vitreous humour. According to Sharp, the *glaucoma* of the Greeks is the same as the cataract; and according to St. Yves and others, it is a cataract with amaurosis. Dimness or abolition of sight from opacity of the humours. "*Glaucoma* consists in a change of structure in the vitreous humour. Arthritic inflammation of the internal tunics of the eye, (an inflammation commencing in parts most essential to the function of vision, in the retina, in the vitreous humour, and probably involving the choroid coat,) has sometimes been called *acute glaucoma*, this term being derived from the greenish appearance of the eye. It has been called *glaucoma* from another symptom, which takes place, where, without any enlargement of the vessels, without any very severe pain or absolute extinction of vision in the first place, the pupil exhibits the same greenish discoloration, a discoloration which obviously does not depend on a change in the crystalline lens; for it is more deeply seated,—it occupies the fundus of the eye, and you can only see it by looking at it, when you are standing directly before the patient, not by looking at the eye side-ways This is called *glaucoma* simply; and it appears to me to be a *chronic* form of the same affection as that to which the term *acute glaucoma* is given. This *chronic* form of *glaucoma* is important to be observed; for it is liable to be confounded with cataract."—Mr. Lawrence's *Lectures on Surgery.*

Gothic architecture so restricted, has been divided into three distinct periods which have been variously named by different authors, but the terms which have been most generally used are those bestowed by Mr. Rickman. 5. The system of polity in a state; that form of fundamental rules and principles by which a nation or state is governed, or by which individual members of a body politic are to regulate their social actions; a constitution, either written or unwritten, by which the rights and duties of citizens and public officers are prescribed and defined; as, a monarchical *government*, or a republican *government*. The *British government* is a term by which is meant the constitution of the country, as vested in the king and parliament. Its great powers are the *legislative* and *executive*; the former prescribing the rules which the people are to obey, and by which their rights and privileges are to be regulated—the latter enforcing those rules, ordering peace and war, and performing the other great executive functions of the state. The legislative power is placed in the three estates of Parliament,—the king, the lords spiritual and temporal, and the representatives of the people in the commons house of parliament. Those bodies may be said to be the representatives of monarchy, aristocracy, and democracy. Each, by itself, possesses the spirit of that form to which it is analogous; and each having a separate voice in the legislature, all that is beneficial in each form of government is infused into the laws; while the *veto*, which each estate possesses, acts as a check, which, in a great measure, prevents the admission of what is bad in the simpler forms of government, when acting by themselves, and without control. The executive power is vested in the king, who is assisted in the discharge of it by his ministers. Thus, the British Government unites the energy and splendour of a monarchy to the wisdom and dignity of an aristocracy, and the public virtue, independence, and enterprise of a well-regulated democracy. A common form of the steam-engine *governor* is shown in the annexed figure. It represents a spindle kept in motion by the engine. A and B are two centrifugal balls, CA and CB the rods which suspend the balls. These rods cross one another and pass through the spindle at C, where the whole are connected by a round pin put through the spindle and the rods which serves as the point of suspension for the centrifugal balls or revolving pendulums. A piece of brass M is made to slide up and down

Governor.

upon the upper part of the spindle, and to this piece the end of the lever NO, whose fulcrum is at P, is attached. This piece of brass is also connected with the ball rods by two short pieces, and joints DE, FG. When the engine goes too fast, the balls fly farther asunder and depress the end N of the lever, which partly shuts a throttle valve connected with the end O, and thus diminishes the quantity of steam admitted into the cylinder; and, on the other hand, when the engine goes too slow, the balls fall down towards the spindle and elevate the end N of the lever, which partly opens the throttle-valve and increases the quantity of steam admitted into the cylinder. By this ingenious contrivance, therefore, the quantity of steam admitted to the cylinder is exactly proportioned to the resistance of the engine, and the velocity kept constantly the same. A similar contrivance is applied to a water-wheel to regulate the supply of water.

Granite is one of the most abundant rocks seen at or near the surface of the earth; it is likewise considered as the foundation rock of the globe, or that upon which all secondary rocks repose In Alpine situations it presents the appearance of having broken through the more superficial strata of the earth; the beds of other rocks in the vicinity rising towards it, at increasing angles of elevation as they approach it. It forms some of the most lofty of the mountain chains of the eastern continent, and the central parts of the principal mountain ranges of Scandinavia, the Alps, the Pyrenees, and the Carpathian mountains, are of this rock. No organic fossil remains have ever been found in granite, although it is sometimes found overlying strata containing such remains. Granite supplies the most durable materials for building, as many of the ancient Egyptian monuments testify. It varies much in hardness as well as in colour; accordingly there is much room for care and taste in its selection. Granite, in which feldspar predominates, is not well adapted for buildings, as it cracks and crumbles down in a few years. The Aberdeen bluish granite is celebrated for its great durability, and also for its beauty.

Pure specimens contain about 4 or 5 per cent. of iron, but sometimes the quantity of iron amounts to 10 per cent. Native graphite is only a mechanical mixture of iron and charcoal, while artificial graphite is a real carburet. Graphite may be heated to any extent in close vessels without change; it is exceedingly unchangeable in the air; it has an iron-gray colour, metallic lustre, and granular texture; and is soft and unctuous to the touch. GRAV'ITATE, *v. i.* [Sp. *gravitar;* Fr. *graviter;* from L. *gravitas,* from *gravis,* heavy.] To tend to the centre of a body, or the central point of attraction. Thus a body elevated above the earth tends to fall, that is, it *gravitates* toward the centre of the earth; and the planets are supposed to *gravitate* toward the sun, or centre of the solar system.

GRAV'ITATING, *ppr.* Tending to the centre of a body or system of bodies.

GRAVITA'TION, *n.* The act of tending to the centre.—2. The force by which bodies are pressed or drawn, or by which they tend toward the centre of the earth or other centre, or the effect of that force. Thus the falling of a body to the earth is ascribed to *gravitation.* The attraction of *gravitation* exists between bodies in the mass, and acts at sensible distances. It is thus distinguished from chemical and cohesive attractions which unite the particles of bodies together, and act at insensible distances, or distances too small to be measured.—*Terrestrial gravitation,* that which respects the earth, or by which bodies descend, or tend towards the centre of the earth. All bodies, when unsupported, fall by gravitation towards the earth, in straight lines tending to its centre.—*General* or *universal gravitation,* that by which all the planets tend towards one another, and indeed, by which all the bodies and particles of matter in the universe tend towards one another. The theory of *universal gravitation* was established by Newton. He proved that the moon gravitates towards the earth, and the earth towards the moon, all the secondaries to their primaries; and these to their secondaries; also the primaries to the sun, and the sun to the primaries. It is also highly probable, that the bodies of the solar system, and those of other systems, gravitate mutually towards each other. The terms *gravitation* and *gravity* are generally used synonymously.

GRAV'ITY, *n.* [Fr. *gravité;* Sp. *gravidad;* L. *gravitas,* from *gravis,* heavy. *See* GRAVE.] 1. Weight; heaviness.—2. In *philosophy,* that force by which bodies tend or are pressed or drawn toward the centre of the earth, or toward some other centre, or the effect of that force; in which last sense *gravity* is synonymous with *weight.* *Gravity* is the tendency of great bodies to a centre, or the sum or results of all the attractions of all the molecules composing a great body. The power or force of gravity is supposed to act throughout nature, so that all bodies, as well as the particles of the same body, have a tendency to approach each other in proportion to their masses or quantities of matter, but lessening in force as the squares of the distances between the centres of the several masses are increased. *Gravity* and *attraction* are often used synonymously, but the latter is applied more generally: we speak, for example, of *capillary attraction* and *magnetic attraction,* but not of *capillary* or *magnetic gravity.*—*Centre of gravity.* [*See* CENTRE.]—*Absolute gravity,* that by which a body descends freely and perpendicularly in a vacuum or non-resisting medium.—*Relative gravity,* that by which a body descends when the absolute gravity is constantly counteracted by a uniform but inferior force, such as in the descent of bodies down inclined planes, or in resisting mediums, as air and water.—3. *Specific gravity,* the weight belonging to an equal bulk of every different substance. Or *specific gravity* may be defined, the relative gravity or weight of any body or substance considered with regard to

the weight of an equal bulk of some other body which is assumed as a standard of comparison. The standard for the specific gravities of solids and liquids is pure distilled water at the temperature of 60°, which is reckoned unity, and by comparing the weights of equal bulks of other bodies with this standard, we obtain their specific gravities. Thus, if we take equal bulks of water, silver, and platina, and weigh them, the silver will be found to be 10.5 times, and the platina 21.4 times heavier than the water; and reckoning the specific gravity of water unity, the specific gravity of silver is said to be 10.5, and that of platina 21.4. The practical rule is, weigh the body in air, then in pure distilled water, and the weight in air divided by the loss of weight in water, will give the specific gravity of the body. One substance is said to have a greater specific gravity than another, when a given bulk of the former weighs more than the same bulk of the latter. In designating the specific gravities of gases, the standard or unity is atmospheric air.—*The line of direction of gravity* is the straight line which passes through the centre of gravity of a body in a direction towards the centre of the earth, and it is the line which the centre of gravity describes when the body is allowed to fall freely. [*See* HYDROSTATIC BALANCE and HYDROMETER.]—4. Seriousness; sobriety of manners; solemnity of deportment or character.

"Keto bore to Phorcus the Graiæ with fair cheeks, *white* from their birth, and hence they were called Graiæ." The Greek word γραια is rendered an old woman, and in this passage of Hesiod, is supposed to mean certain deities. The probability is, that it is applied to an old woman, because she is *gray*. But the fable of Hesiod is easily explained by supposing the author to have had in his mind some imperfect account of the origin of the Greeks.] 1. White, with a mixture of black.

These fragments are sometimes angular, and sometimes their edges and angles are rounded, thus forming nodules or globular masses. The size is very variable, passing from grains to nodules of a foot in diameter. The several ingredients are united by an indurated argillaceous substance, or the interstices between the larger fragments are filled by the same materials which compose the larger parts of the rock, but in grains so comminuted as to resemble a homogeneous cement. The colours are some shade of gray or brown, as bluish gray, reddish brown, &c. The *graywacke* rocks compose the lowest members of the secondary strata. Mr. Lyell includes in this group, the Ludlow, Wenlock, and Dudley, Horderly, and Mayhill rocks, the Builth, and Llandeilo flags, and the Longmynd rocks. It comprehends the Doric, Ionic, and Corinthian orders, to which may probably be added the Caryatic order. Of these the Doric is the most distinctive, and may be regarded as the national style. The architecture of the Greeks is known to us only through the remains of their sacred edifices and monuments, and we have no means of ascertaining in what manner it was applied to their houses. Simple and grand in their general composition, perfect in proportion, enriched, yet not encumbered with ornament of consummate beauty, these remains cannot be surpassed in harmony of proportion and beauty of detail.
